Since its publication in 1888, H. P. Blavatsky's *The Secret Doctrine* has generated a continuing interest in the sources that are quoted or referenced. Building on research that started over a century ago, this compilation follows the pagination of the original 1888 edition. Excerpts from *The Secret Doctrine* are in **bold** type and are followed by references citing author, title, and date.

p/q: introduces a reference to a source that is paraphrased or quoted. All others are introduced by SEE:.

Curly brackets { } denote excerpts from footnotes in the referenced material.

Square brackets [] are used for translations and editorial insertions.

Secret Doctrine References — An Introduction

By Ina Belderis

The Secret Doctrine is considered H. P. Blavatsky's masterpiece, and ever since its publication in 1888 it has been the subject of both admiration and criticism. She herself said that the work was meant to demonstrate the existence of a core of ideas which she referred to as the Ancient Wisdom. The purpose of the book was to show the universal character of this Wisdom Tradition, and where the serious seeker can find it.

In *The Secret Doctrine* hundreds of different books and articles are quoted. Where did all of this material come from? She did not have a library that contained all these books. Archibald Keightley, who with his uncle Bertram, assisted her in organizing and rearranging the manuscript, remarked: "What struck me most in the part I was able to read during my short stay was the enormous number of quotations of various authors. I knew there was no library to consult and I could see that HPB's own books did not amount to thirty in all, of which several were dictionaries and several works counted two or more volumes." (Wachtmeister, p. 84) Blavatsky herself explains that "Master is collecting material for me." (op.cit. p. 14) W. Q. Judge mentions that HPB conversed with him about the book she was working on, and that "a serious series of consultations was held among them (HPB and her Teachers) as to what should go into *The Secret Doctrine*, and that it was plainly said that the book was to be done in such a manner as to compel the earnest student to dig out many profound truths . . . It was also said, from the same source, that this age, being a transition one, in all respects, that full revelations were not for this generation." (op.cit. p. 90)

In her article "My Books" HPB mentions that "every word of information found in this work (*Isis*) or in any later writings, comes from the teachings of our Eastern Masters, and that many a passage in these works has been written by me *under their dictation*." (*Lucifer*, v. 8, p. 243)

Countess Wachtmeister asked HPB once why she sometimes seemed to be doing the same passage over and over again. HPB explained that she had tried twelve times to write a certain page correctly, and each time her Teacher said it was wrong. After Wachtmeister asked her why she made mistakes, she said "if I need a reference or information from some book, I fix my mind intently, and the astral counterpart of the book appears, and from it I take what I need. The more perfectly my mind is freed from distractions and mortifications, the more energy and intentness it possesses, the more easily I can do this; but today, after all the vexation I have undergone . . . I could not concentrate properly, and each time I tried I got the quotation all wrong. Master says it is right now . . ." (Wachtmeister, pp. 24-5)

So *The Secret Doctrine* is the result of the cooperation between H.P. Blavatsky and her Teachers. She wrote it down, but the material was provided by them. And this material did not come in such a way that it was immediately ready for publication. Bertram Keightley remarks, "Before I had read much, it became plain that *The Secret Doctrine* was destined to be by far the most important contribution of this century to the literature of occultism; though even then the inchoate and fragmentary nature of much of the work led me to think that careful revision and much rearrangement would be needed before the manuscript would be fit for publication." (op.cit., p. 77) Both the Keightleys and Countess Wachtmeister assisted HPB in rearranging and reorganizing the manuscript. Her sources were also checked as much as possible, and the

manuscript was pasted, cut, and repasted several times before it was finally published in 1888. (op.cit. p. 85).

Because of the large number of quotations and references, HPB has been accused of plagiarism. But what exactly is plagiarism? Plagiarism is generally defined as the unauthorized use or close imitation of the language and thoughts of another author and the representation of them as one's own original work. A quick look at the end of the Introductory section to *The Secret Doctrine* leads us to the following text, quoted by H. P. Blavatsky, "I may repeat what I have stated all along, and which I now clothe in the words of Montaigne: Gentlemen, 'I have here made only a nosegay of culled flowers, and have brought nothing of my own but the string that ties them.'" (SD 1:xlvi) So she very clearly does not represent the language and thoughts of others as her own.

Very often the contents of the books and articles by H. P. Blavatsky are described as "the teachings of H. P. Blavatsky," — or contrasted with the teachings of other people. But calling them "her teachings" is a misnomer, because she herself clearly indicated that they are not hers. She said that the material for *The Secret Doctrine* was provided by her two teachers, but even they do not claim the teachings as their own. What HPB's teachers provided is the wisdom of the ages, and the main point is that one can find it, more or less veiled, in the various religious and philosophical writings of the world, whether ancient or modern, Eastern or Western. Basically the ancient wisdom belongs to everyone, but no one person can claim to be the source.

But again, where does all this information come from? Knowing that it was provided by Blavatsky's teachers does not really answer this question. Many people have searched for these sources over the years, and a number of researchers have published their findings, most notably Boris de Zirkoff in his *General Index and Bibliography to The Secret Doctrine*, and John Van Mater, the compiler of *The Secret Doctrine Index*. With the advent of the Internet and the ability to search through thousands of books by computer, a systematic approach to finding the sources that are quoted or referenced was begun.

Quotations in *The Secret Doctrine References* can be divided into four categories, those for:

1. References from books and articles that HPB quotes from literally, where she mentions the author or the title, on the page in the *SD* where the quote appears, or on an earlier page.
2. Passages that are paraphrased, where she again mentions the author or title.
3. Information that has no author or title citations, on subjects which many authors in her time discussed.
4. References that explain difficult terms and concepts, taken from publications available in her time.

Then there is a small category of references where, as far as can be checked, no material was available or published in her time, but which was covered by later authors. Finally, there are also passages which appear to have been quoted or paraphrased, but the source has not yet been discovered — these are left for future researchers to uncover (there is no category "untraceable"). The general goal was to provide references that readers can find themselves in published material, either available in books that are still in print, or which can be found online. In the case of references where the citation is "Unpublished Manuscript," an attempt has been made to find the same material by the same author in a source that was published.

Sometimes identical passages can be found in more than one of the sources which she regularly quotes. For example, some texts that appear in Cory's *Ancient Fragments*, can also be found in Smith's *Chaldean*

Account of Genesis, Myer's *Qabbalah*, and Higgins' *Anacalypsis*. These and many other authors specialized in comparing ideas from different religions and mythologies, and sometimes different fields of science. They compare hundreds of quotations from religious texts and commentaries, and large collections of authors and titles are given in their footnotes.

When quoting from these works on comparative religion and mythology, HPB often incorporates their footnotes into the quotation. And since many authors have their own distinctive style of abbreviating when giving footnote references, one can often infer which "comparative" work is being quoted by the way the footnotes are abbreviated. For example, Decharme in his *Mythologie de la Grèce Antique* refers to hundreds of classical Greek sources, and so does Bailly in his *Traité de l'Astronomie Indienne et Orientale*. When quoting passages from these books, Blavatsky adds the classical authors and titles that appear in Decharme's and Bailly's footnotes. From the way the names, chapters, and page numbers are abbreviated, one can tell from which source this information comes.

Another problem in tracing a quotation is spelling errors, or errors in punctuation. *The Secret Doctrine* has such errors because a number of people worked on the text, checking, rearranging, cutting and pasting, typing and retyping, and finally typesetting. For example (*SD* 1:349):

"there was a perfect AION who existed before Bythos"

This does not make any sense because "Bythos" is a Gnostic term for the "Great Deep," the very first Æon, the primordial Chaos that existed before anything had formed. This quotation actually comes from Dunlap's gnostic treatise, *Sōd, The Son of the Man* (p. 32 fn.) :

"there was a perfect Aiōn who existed before, called Buthon [Bythos]"

With the comma in the proper place, the meaning is: There was a perfect Æon that existed before [anything else], and it was called Bythos.

Another difficulty in tracing sources is Blavatsky's use of translations and commentaries in languages other than English. French was HPB's second language after Russian. As French was the cultural language in Europe at the time, she makes ample use of a large number of French books. She translates French passages into English throughout *The Secret Doctrine*, and her translations are generally good. But in the early years of writing the *SD*, she sometimes "anglicized" a French word when translating into English. Sometimes these words have the same meaning in both languages, but often the meaning of the word in French is slightly different and would not be regarded as "proper" English. Archibald Keightley noticed this as he read through her manuscript, and he also remarked that these literal translations happened less and less after HPB moved to England. (Wachtmeister, p. 85)

Blavatsky specifically chose those translators and commentators who gave the reader a better insight into the ancient wisdom, and whose comments showed that the perennial philosophy can indeed be found in different religions and philosophies. For example, the *SD* has scores of quotations from the Egyptian *Book of the Dead*, but many of them are very different from the most well-known English translations. The reason is that Blavatsky used the French translation by Paul Pierret, *Le Livre des Morts*, which has notes at the end of each chapter, and a comprehensive "Index Analitique" at the end of the book. HPB made extensive use of Pierret's text and notes, translating his French into English.

Sometimes Blavatsky quoted Russian authors, and many of these were not translated into English in her

time. On p. xxxiii of the Introduction, there is a description of the explorer Prjevalski finding the ruins of cities, close to the oasis of Tchertchen (Takla Makan desert, Central Asia). He describes mummies, human remains of very tall people, who also looked very different from the people who now live in and around this area. The mummies he was describing are now called the Urumqi mummies in Xinjiang, China, named after the city where the mummies are kept in a museum. Prjevalski's book about his travels was written in Russian, and no English translation was available. But there was a translation into Swedish, made by the explorer Sven Hedin. Then in 1939 Folke Bergman translated parts of Sven Hedin's Swedish book into English for his publication *Archaeological Researches in Sinkiang*. It is especially interesting that the one long passage that he chose to translate is exactly that passage chosen by HPB — the narrative about the Mummies of Tchertchen.

The Secret Doctrine has hundreds of quotations from the “Kabbalah,” but most of these come from well-known commentators and translators. When HBP writes “the Zohar says” or “the Sepher Jezirah mentions,” and includes chapter and page numbers, she is actually quoting from works by Myer, Ginsburg, Franck, Lévi, MacGregor Mathers, Skinner, and Mackenzie. Many of the passages translated by these authors are nearly identical, so many of these *SD* quotations can be found in a number of different books.

This also happens when she cites Greek and Latin sources. For example (*SD* 2:600):

“. . . according to Theon, the Pythagoreans who gave the name of Harmony to the Tetraktis, 'because it is a diatessaron in sesquitertia' — were of the opinion . . .”

This seems to come straight from Theon, but in fact it comes from Oliver's *The Pythagorean Triangle* (p. 114):

“The name of Harmony was given to the tetrad, because it is a diatessaron in sesquitertia. The Pythagoreans, however, were of opinion, according to Theon . . .”

Many of the *SD*'s classical references come from French commentators, such as De Mirville (*Des Esprits*), Decharme (*Mythologie de la Grèce Antique*), and Bailly (*Traité de l'Astronomie Indienne et Orientale*). For instance (*SD* 2:620):

“Moreover, Diodorus Siculus (Lib. I. § 26, p. 30) calls ‘*thirty days* an Egyptian year,’ or that period during which the moon performs a complete revolution. Pliny and Plutarch both speak of it (*Hist. Nat. Lib. VII., c. 48, Vol. III., p. 185, and Life of Numa, § 16*) . . .”

These classical references — (Lib. I. § 26, p. 30), (*Hist. Nat. Lib. VII., c. 48, Vol. III., p. 185, and Life of Numa, § 16*) — duplicate references that appear in Bailly's book (p. lxxxxvi) with Bailly's footnotes in curly brackets:

“La révolution entière de la lune est cette espèce d'année dont parle Diodore de Sicile; cette année de 30 jours, connue en Egypte {Diod. *Lib. I, §. 26, p. 30*}, également attestée par Pline {Pline *Hist. nat. Lib. VII, c. 48, Tom. 3, p. 185*}, & par Plutarque {Vie de Numa, §. 16}”

In translation:

“The entire revolution of the moon is that part of the year of which Diodorus of Sicily speaks; that year of 30 days, known in Egypt, and also mentioned by Pliny and Plutarch.”

The footnotes in Bailly's Preface show the abbreviated titles of books by Diodorus, Pliny and Plutarch.

Here is a clear instance of the benefit of comparing an *SD* passage with the original source (*SD* 2:54):

“The Cosmogonical tablets prove that this our actual creation was preceded by others (See ‘Hibbert Lectures,’ p. 390); and as shown by the author of ‘The Qabbalah,’ in the Zohar, Siphrah Dzeniouta, in Jovah Rabbah, 128a, etc., etc. The Kabala states the same.”

What does “The Kabala states the same” mean? All of this information comes directly from Myer's *Qabbalah*, p. 246 & footnotes. The last footnote on that page reads: “Franck's *La Kabbale*, p. 205 sq.” *La Kabbale* is the title of a well-known kabbalistic treatise in French, by Adolphe Franck. “The Kabala says the same” means the same interpretation can be found in Franck's *La Kabbale*.

Another example of how the original source can explain an obscure *SD* passage can be found in *SD* 2:222:

“All except Xisuthrus and Noah, who are substantially identical with the great Father of the Thlinkithians in the *Popol-Vuh*, or the sacred book of the Guatamaleans, which also tells of his escaping in a large boat like the Hindu Noah — Vaivasvata.”

The Thlinkithians or Thlinkit Indians live in Alaska, Yukon, and British Columbia, while the *Popol-Vuh* is the sacred book of the Quiché Maya in Guatemala. So how does this fit together? We can find this in Max Müller's *Chips from a German Workshop* (1:338), in his chapter called “The Popol-Vuh”:

“The Thlinkithians are one of the four principal races inhabiting Russian America. . . . These Thlinkithians believe in a general flood or deluge, and that men saved themselves in a large floating building.”

So in Max Müller's chapter on the “Popol-Vuh,” he finds strong similarities in comparing the creation stories of the Thlinkit Indians and the Mayans.

Tracing the references in *The Secret Doctrine* back to their sources can give the reader a great deal of insight into what HPB is trying to say. Moreover, many of these sources have more information about the subject matter. But even if we had access to the many hundreds of books and articles that are quoted in the *SD*, we would still have only a fraction of the real “Secret Doctrine.” As Blavatsky writes (*SD* 1:xxii), she could outline only a few truths, “because that which must remain unsaid could not be contained in a hundred such volumes, nor could it be imparted to the present generation of Sadducees.”

In addressing the question as to whether she would ever publish more volumes of *The Secret Doctrine*, she said that it would entirely depend on how Volumes I and II were received. But there is certainly enough material in HPB's writings “to compel the earnest student to dig out many profound truths” on their own. In “The Babel of Modern Thought” (*Lucifer*, v. 7, p. 442), Blavatsky summed up what was important about *The Secret Doctrine*:

“. . . the *Secret Doctrine* merely asserts that a system, known as the WISDOM-RELIGION, the work of generations of adepts and seers, the sacred heirloom of pre-historic times — actually exists, though hitherto preserved in the greatest secrecy by the present Initiates; and it points to various corroborations of its existence to this very day, to be found in ancient and modern works.”

In other words, she set out to show that the esoteric philosophy exists and that it can be found all over the world, in its sacred writings, and in the commentaries of those writers who had a sense of the Wisdom Tradition. *The Secret Doctrine* accomplishes that goal for all those who will take the trouble to make themselves acquainted with it.

the destruction of the Alexandrian Library

SEE: H. P. Blavatsky, *Isis Unveiled*, 1877: “At the time of the contest for the throne, in 51 B.C., between Cleopatra and her brother Dionysius Ptolemy, the Bruckion, which contained over seven hundred thousand rolls, all bound in wood and *fire-proof* parchment, was undergoing repairs, and a great portion of the original manuscripts, considered among the most precious, and which were not duplicated, were stored away in the house of one of the librarians. As the fire which consumed the rest was but the result of accident, no precautions had been taken at the time. But they add, that several hours passed between the burning of the fleet, set on fire by Caesar’s order, and the moment when the first buildings situated near the harbor caught fire in their turn; and that all the librarians, aided by several hundred slaves attached to the museum, succeeded in saving the most precious of the rolls.” — 2:27

p/q: H. P. Blavatsky, *Isis Unveiled*, 1877: “The esoteric doctrine, then, teaches, like Buddhism and Brahmanism, and even the persecuted *Kabala*, that the one infinite and unknown Essence exists from all eternity, and in regular and harmonious successions is either passive or active. In the poetical phraseology of Manu these conditions are called the ‘day’ and the ‘night’ of Brahma. The latter is either ‘awake’ or ‘asleep.’ The Svābhāvikas, or philosophers of the oldest school of Buddhism (which still exists in Nepaul), speculate but upon the active condition of this ‘Essence,’ which they call Svabhāvāt, and deem it foolish to theorize upon the abstract and ‘unknowable’ power in its passive condition.” — 2:264

Blavatsky, *Isis Unveiled*, 1877: “The former will allow of no other God than the personified *secondary* powers which have blindly worked out the visible universe, and which became with them the anthropomorphic God of the Christians — the Jehovah, roaring amid thunder and lightning. In its turn, rationalistic science greets the Buddhists and the Svābhāvikas as the ‘positivists’ of the archaic ages. If we take a one-sided view of the philosophy of the latter, our materialists may be right in their own way. The Buddhists maintain that there is *no* Creator but an infinitude of *creative powers*, which collectively form the one eternal substance, the *essence* of which is inscrutable — hence not a subject for speculation for any true philosopher. In like manner, when the passive condition is resumed, a contraction of the Divine essence takes place, and the previous work of creation is gradually and progressively undone. The visible universe becomes disintegrated, its material dispersed; and ‘darkness,’ solitary and alone, broods once more over the face of the ‘deep.’ To use a metaphor which will convey the idea still more clearly, an outbreathing of the ‘unknown essence’ produces the world; and an inhalation causes it to disappear. *This process has been going on from all eternity, and our present universe is but one of an infinite series which had no beginning and will have no end.*” — 2:264-5

There was no confine betwixt day and night;

Yeu is “Being” or “Subhâva” . . .

SEE: Joseph Edkins, *Chinese Buddhism*, 1880: “All kinds of action (or existence) . . . are different in name, but the same in meaning. Whichever of these we speak of, the only difference between them is in the word *yeu*, ‘to be.’ This word *yeu* is, in the original language, *subhava*. It is translated in several ways, as ‘the substance which gives substance to itself,’ or as ‘without action and with action,’ or as ‘the nature which has no nature of its own.’ ” — pp. 308-9

***Subhâva* . . . is composed of two words: *Su* . . . and *bhava* . . .**

a dialogue between Speech and Mind. “Both went to the Self of Being . . .”

p/q: *The Bhagavadgītā, Sanatsujātīya and Anugītā*, tr. K. T. Telang, 1882: “But since you ask me a question regarding speech and mind, I will relate to you a dialogue between themselves. Both speech and mind went to the self of all beings and spoke (to him thus), ‘Say which of us is superior; destroy our

doubts, O lord!’ Thereupon the lord positively said to speech, ‘Mind (is superior).’ But speech thereupon said to him, ‘I, verily, yield (you) your desires.’ ” — p. 263 (*Anugītā*, vi)

“Thereupon, again, the Self told her that there are two minds . . .”

p/q: *The Bhagavadgītā, Sanatsujātīya and Anugītā*, tr. K. T. Telang, 1882: “Know, that (in) my (view), there are two minds, immovable and also movable. The immovable, verily, is with me; the movable is in your dominion. Whatever mantra, or letter, or tone goes to your dominion, that indeed is the movable mind. To that you are superior. But inasmuch, O beautiful one! as you came personally to speak to me (in the way you did), therefore, O Sarasvatī! you shall never speak after (hard) exhalations.” — p. 264 (*Anugītā*, vi)

“The goddess Speech . . . verily, dwelt always between the Prāṇa and the Apāna . . .”

p/q: *The Bhagavadgītā, Sanatsujātīya and Anugītā*, tr. K. T. Telang, 1882: “The goddess speech, verily, dwelt always between the Prāṇa and Apāna. But, O noble one! going with the Apāna wind, though impelled, (in consequence of) being without the Prāṇa, she ran up to Prajāpati, saying, ‘Be pleased, O venerable sir!’ Then the Prāṇa appeared again nourishing speech. And therefore speech never speaks after (hard) exhalation. It is always noisy or noiseless. Of those two, the noiseless is superior to the noisy (speech).” — pp. 264-5 (*Anugītā*, vi)

“The (speech) which is produced in the body . . .”

p/q: *The Bhagavadgītā, Sanatsujātīya and Anugītā*, tr. K. T. Telang, 1882: “The (speech) which is produced in the body by means of the Prāṇa, and which then goes into the Apāna, and then becoming assimilated with the Udāna leaves the body . . . then (finally) dwells in the Samāna. So speech formerly spoke. Hence the mind is distinguished by reason of its being immovable, and the goddess distinguished by reason of her being movable.” — pp. 265-6 (*Anugītā*, vi)

The limit produced is a point, the essence of which is motion; but being without parts, this essence is not actual motion but only a conatus [vital impulse] to it. From this first proceed extension, space, figure and succession or time. As in geometry a point generates a line, a line a surface, and a surface a solid, so here the conatus of a point tends towards lines, surfaces and solids. In other words, the universe is contained *in ovo* in the first natural point. The motion toward which the conatus tends is circular, since the circle is the most perfect of all figures . . . ‘The most perfect figure of the motion above described must be the perpetually circular; that is to say, it must proceed from the centre to the periphery and from the periphery to the centre.’ ” — p. 567 (Swedenborg, *Principia Rerum Naturalium*)

Now the whole manifested solar system exists in its *sukshma* form in this light or energy of the *Logos*, because its image is caught up and transferred to cosmic matter, and again the whole cosmos must necessarily exist in the one source of energy from which this light emanates.” — p. 307 (*The Theosophist*, v. 8)

p/q: William Crookes, “Elements and Meta-Elements,” March 28, 1888: “Where then are we to draw the line? The different groupings shade off so imperceptibly the one into the other . . . Is there no way out of this perplexity? Must we either make the elementary examinations so stiff that only some 60 or 70 candidates can pass, or must we open the examination doors so wide that the number of admissions is limited only by the number of applicants?” — p. 207 (*Chemical News*, May 25, 1888)

“Take the case of yttrium. It has its definite atomic weight . . .”

p/q: William Crookes, “Address of the President,” March 28, 1888: “Take the case of yttrium. It has its definite atomic weight; it behaved in every respect as a simple body, an element, to which we might indeed add, but from which we cannot take away. Yet this yttrium, this supposed homogeneous whole, on being submitted to a certain method of fractionation, is resolved into portions not absolutely identical among themselves, and exhibiting a gradation of properties. Or take the case of didymium: here was a body betraying all the recognised characters of an element. It had been separated with much difficulty from other bodies which approximated closely to it in their properties, and during this crucial process it had undergone very severe treatment and very close scrutiny.” — p. 217 (*Chemical News*, June 1, 1888)

“But then came another chemist . . .”

p/q: William Crookes, “Address of the President,” March 28, 1888: “But then came another chemist who, treating this assumed homogeneous body by a peculiar process of fractionation, resolved it into the two bodies praseodymium and neodymium, between which certain distinctions are perceptible. Further, we even now have no certainty that neodymium and praseodymium are simple bodies. On the contrary, they likewise exhibit symptoms of splitting up. Now, if one supposed element on proper treatment is thus found to comprise dissimilar molecules, we are surely warranted in asking whether similar results might not be obtained in other elements, perhaps in all elements, if treated in the right way? We may even ask where the process of sorting-out is to stop? a process which of course presupposes variations between the individual molecules of each species. And in these successive separations we naturally find bodies approaching more and more closely to each other.” — p. 217 (*Chemical News*, June 1, 1888)

P/Q: A. P. Sinnett, *Esoteric Buddhism*, 1885: “The full development of the mineral epoch on globe A prepares the way for the vegetable development, and as soon as this begins, the mineral life impulse overflows into globe B. Then when the vegetable development on globe A is complete and the animal development begins, the vegetable life impulse overflows to globe B, and the mineral impulse passes on to globe C. Then, finally, comes the human life impulse on globe A.” — pp. 48-9

“... there are processes of evolution ...”

p/q: A. P. Sinnett, *Esoteric Buddhism*, 1885: “. . . there are processes of evolution which precede the mineral evolution, and thus a wave of evolution, indeed several waves of evolution, precede the mineral wave in its progress round the spheres.” — p. 49

“There are seven kingdoms. . . .”

p/q: “About the Mineral Monad,” 1885: “There are *seven* kingdoms. The first group comprises three degrees of elementals, or nascent centres of forces — from the first stage of the differentiation of *Mulaprakriti* to its third degree — *i.e.*, from full unconsciousness to semi-perception; the second or higher group embraces the kingdoms from vegetable to man; the mineral kingdom thus forming the central or turning-point in the degrees of the ‘Monadical Essence’ — considered as an Evolving Energy. Three stages in the elemental side; the mineral kingdom; three stages in the objective physical side — these are the seven links of the evolutionary chain.” — p. 276 (*Five Years of Theosophy*)

“A descent of spirit into matter . . .”

p/q: “About the Mineral Monad,” 1885: “A descent of spirit into matter, equivalent to an ascent in physical evolution; a re-ascent from the deepest depths of materiality (the mineral) towards its *status quo ante*, with a corresponding dissipation of concrete organisms up to Nirvana — the vanishing point of differentiated matter.” — p. 276 (*Five Years of Theosophy*)

— 177 —

there are the three elemental Kingdoms, which precede the Mineral

“. . . the three successive stages passed by the spiritual impulse (through the elementals . . .) before they are imprisoned in the most concrete form of matter . . .” — p. 277 (*Five Years of Theosophy*)

And what relation does it bear to an Atom? . . . “None whatever . . .”

p/q: “About the Mineral Monad,” 1885: “What relation does the monad bear to the atom? None whatever to the atom or molecule as in the scientific conception at present. It can neither be compared with the microscopic organism classed once among polygastric infusoria, and now regarded as vegetable and ranked among algae; nor is it quite the *monas* of the Peripatetics. Physically or constitutionally the mineral monad differs, of course, from the human monad, which is neither physical nor can *its* constitution be rendered by chemical symbols and elements.” — pp. 273-4 (*Five Years of Theosophy*)

— 177-8 —

In short, as the spiritual Monad is One . . . so the Mineral Monad . . .

p/q: “About the Mineral Monad,” 1885: “In short, the mineral Monad is *one* — the higher animal and human monads are countless. Otherwise, how could one account for and explain *mathematically* the evolutionary and *spiral* progress of the four kingdoms?” — p. 274 (*Five Years of Theosophy*)

— 178 —

The “Monad” is the combination of the last two “principles” in man . . .

p/q: “About the Mineral Monad,” 1885: “The ‘monad’ is the combination of the last two Principles in man, the 6th and the 7th, and, properly speaking, the term ‘human monad’ applies only to the Spiritual Soul, not to its highest spiritual vivifying Principle. But since divorced from the latter the Spiritual Soul could have no existence, no being, it has thus been called.” — p. 274 (*Five Years of Theosophy*)

Now the Monadic, or rather Cosmic, Essence . . . in the mineral, vegetable, and animal . . .

p/q: “About the Mineral Monad,” 1885: “Now the Monadic Essence (if such a term be permitted) in the mineral, vegetable, and animal, though the same throughout the series of cycles from the lowest elemental up to the Deva kingdom, yet differs in the scale of progression. It would be very misleading to imagine a monad as a separate entity trailing its slow way in a distinct path through the lower kingdoms, and after an incalculable series of transmigrations flowering into a human being; in short, that the monad of a Humboldt dates back to the monad of an atom of horneblende. Instead of saying a mineral monad, the correcter phraseology in physical science which differentiates every atom, would of course have been to call it *the* Monad manifesting in that form of Prakriti called the mineral kingdom.” — pp. 274-5 (*Five Years of Theosophy*)

The atom, as represented in the ordinary scientific hypothesis . . .

p/q: “About the Mineral Monad,” 1885: “Each atom or molecule of ordinary scientific hypothesis is not a particle of something, animated by a psychic something, destined to blossom as a man after aeons. But it is a concrete manifestation of the Universal Energy which itself has not yet become individualized: a sequential manifestation of the one Universal Monas. The ocean does not divide into its potential and constituent drops until the sweep of the life-impulse reaches the evolutionary stage of man-birth. The tendency towards segregation into individual monads is gradual, and in the higher animals comes almost to the point.” — p. 275 (*Five Years of Theosophy*)

The Peripatetics applied the word Monas to the whole Kosmos . . .

p/q: “About the Mineral Monad,” 1885: “The Peripatetics applied the word Monas to the whole Cosmos, in the pantheistic sense; and the Occultists while accepting this thought for convenience’ sake, distinguish the progressive stages of the evolution of the Concrete from the Abstract by terms of which the ‘Mineral Monad’ is *one*. The term merely means that the tidal wave of spiritual evolution is passing through that arc of its circuit.” — p. 275 (*Five Years of Theosophy*)

— 178-9 —

The ‘Monadic Essence’ begins to imperceptibly differentiate . . .

p/q: “About the Mineral Monad,” 1885: “The ‘Monadic Essence’ begins to imperceptibly differentiate in the vegetable kingdom. As the monads are un-compounded things, as correctly defined by Leibnitz, it is the spiritual essence which vivifies them in their degrees of differentiation which constitutes properly the monad — not the atomic aggregation which is only the *vehicle* and the substance through which thrill the lower and the higher degrees of intelligence.” — p. 275 (*Five Years of Theosophy*)

p/q: H. P. Blavatsky, *Isis Unveiled*, 1877: “A Hanoverian scientist has recently published a work entitled *Ueber die Auflösung der Arten durch Natürliche Zucht Wahl*, in which he shows, with great ingenuity, that Darwin was wholly mistaken in tracing man back to the ape. On the contrary, he maintains that it is the ape which has evolved from man. That, in the beginning, mankind were, morally and physically, the types and prototypes of our present race and of human dignity, by their beauty of form, regularity of feature, cranial development, nobility of sentiments, heroic impulses, and grandeur of ideal conceptions.” — 2:278 fn.

And, as one portion has already degenerated into apes, so the civilized man of the present day will at last, under the action of the inevitable law of necessity, be also succeeded by like descendants. p/q: *The Virgin of the World*, tr. Kingsford & Maitland, 1885:

Tatios. Then the celestial bodies themselves are not real, my father, since they also vary.

Trismegistos. That which is subject to birth and to change is not real . . . there is in them a certain falsity, seeing that they too are variable . . .

Tatios. And what, then, is the primordial Reality, O my father?

Trismegistos. He Who is One and alone, O Tatios; He Who is not made of matter, nor in any body, Who has neither colour nor form, Who changes not, nor is transmuted, but who always Is.” — pp. 137-8 (*Fragments, Hermes to his Son Tatios*, VII)

Those who are thus illumined are few in number, and from them the genii abstain; for neither genii nor gods have any power in the presence of a single ray of God. But all other men, both soul and body, are directed by genii, to whom they cleave, and whose operations they affect. But reason is not like desire, which deceives and misleads. p/q: Henry Thomas Buckle, *History of Civilization in England*, 1864: “Owing to circumstances still unknown, there appear, from time to time, great thinkers, who, devoting their lives to a single purpose, are able to anticipate the progress of mankind, and to produce a religion or a philosophy, by which important effects are eventually brought about. But if we look into history, we shall clearly see that, although the origin of a new opinion may be thus due to a single man, the result which the new opinion produces will depend on the condition of the people among whom it is propagated. If either a religion or a philosophy is too much in advance of a nation, it can do no present service, but must bide its time, until the minds of men are ripe for its reception.” — 1:186

p/q: Gerald Massey, *Luniolatry; Ancient and Modern*, 1887: “‘We know,’ says Renouf, echoing Max Müller, in his Hibbert Lectures, ‘We know that mythology *is* the disease which springs up at a peculiar stage of human culture.’ Such is the shallow explanation of the non-evolutionists, and such explanations are still accepted by the British public, that gets its thinking done for it by proxy. Professor Max Müller, Cox, Gubernatis and other propounders of the Solar Mythos have portrayed the primitive myth-maker for us as a sort of Germanised-Hindu metaphysician, projecting his own shadow on a mental mist, and talking ingeniously concerning smoke, or, at least, *cloud*; the sky overhead becoming like the dome of dreamland, scribbled over with the imagery of aboriginal nightmares!” — p. 1

— 304 —

“They conceive the early man in their own likeness . . .”

p/q: Gerald Massey, *Luniolatry; Ancient and Modern*, 1887: “They conceive the early man in their own likeness, and look upon him as perversely prone to self-mystification, or, as Fontenelle has it, ‘subject to beholding things that are not there!’ They have misrepresented primitive or archaic man as having been idiotically misled from the first by an active but untutored imagination into believing all sorts of fallacies, which were directly and constantly contradicted by his own daily experience; a fool of fancy in the midst of those grim realities that were grinding his experience into him, like the gri[n]ding icebergs making their imprints upon the rocks submerged beneath the sea.” — p. 1

“It remains to be said, and will one day be acknowledged . . .”

p/q: Gerald Massey, *Luniolatry; Ancient and Modern*, 1887: “It remains to be said, and will one day be acknowledged, that these accepted teachers have been no nearer to the beginnings of mythology and language than Burns’ poet Willie had been near to Pegasus. My reply is, ’Tis but a dream of the metaphysical theorist that mythology was a disease of language, or anything else except his own brain. The origin and meaning of mythology have been missed altogether by these solarites and weather-mongers! Mythology was a primitive mode of *thinging* the early thought [thinking by means of *things*].” — p. 1

“It was founded on natural facts . . .”

p/q: Gerald Massey, *Luniolatry; Ancient and Modern*, 1887: “It was founded on natural facts, and is still verifiable in phenomena. There is nothing insane, nothing irrational in it, when considered in the light of evolution, and when its mode of expression by sign-language is thoroughly understood. The insanity lies in mistaking it for human history or Divine Revelation. Mythology is the repository of man's most ancient science, and what concerns us chiefly is this — when truly interpreted once more it is destined to be the death of those false theologies to which it has unwittingly given birth!” — pp. 1-2

“In modern phraseology a statement is sometimes said to be mythical . . .”

p/q: Gerald Massey, *Luniolatry; Ancient and Modern*, 1887: “In modern phraseology a statement is sometimes said to be mythical in proportion to its being untrue; but the ancient mythology was not a system or mode of falsifying in that sense. Its fables were the means of conveying facts; they were neither forgeries nor fictions. . . . For example, when the Egyptians portrayed the moon as a *Cat*, they were not ignorant enough to suppose that the moon was a cat; nor did their wandering fancies see any likeness in the moon to a cat; nor was a cat-myth any *mere expansion of verbal metaphor*; nor had they any intention of making puzzles or riddles . . .” — p. 2

“They had observed the simple fact that the cat saw in the dark . . .”

p/q: Gerald Massey, *Luniolatry; Ancient and Modern*, 1887: “They had observed the simple fact that the cat saw in the dark, and that her eyes became full-orbed and grew most luminous by night. The moon was the seer by night in heaven, and the cat was its equivalent on the earth; and so the familiar cat was adopted as a representative, a natural sign, a living pictograph of the lunar orb!” — p. 2

— 304-5 —

“And so it followed that the sun . . .”

p/q: Gerald Massey, *Luniolatry; Ancient and Modern*, 1887: “And so it followed that the sun which saw down in the under-world at night, could also be called the cat, as it was, because *it also saw* in the dark. The name of the cat in Egyptian is *mau*, which denotes the seer, from *mau*, to see. One writer on mythology asserts that the Egyptians ‘imagined a great cat behind the sun, which is the pupil of the cat’s eye.’ But this imagining is all modern. It is the Müllerite stock in trade! The moon *as cat was* the eye of the sun, because it reflected the solar light, and because the eye gives back the image in its mirror. In the form of the Goddess Pasht the cat keeps watch for the sun, with her paw holding down and bruising the head of the serpent of darkness, called his eternal enemy!” — p. 2

The latter is “a concrete visible picture . . .”

“All esoteric societies . . .”

p/q: *Royal Masonic Cyclopaedia*, ed. Kenneth R. H. Mackenzie, 1877: “All esoteric societies have made use of emblems and symbols, such as the Pythagorean Society, the Eleusinia, the Hermetic Brethren of Egypt, the Rosicrucians and the Freemasons. Many of these emblems it is not proper to divulge to the general eye, and a very minute difference may make the emblem or symbol differ widely in its meaning. The magical sigilla, being founded on certain principles of numbers, partake of this character, and although monstrous or ridiculous in the eyes of the uninstructed, convey a whole body of doctrine to those who have been trained to recognize them.” — 1:198

On the backs of these images is to be found the ‘*ansated cross*,’ and the same modified to the outlines of the human form. A full description, with plate showing the land, with the thickly planted statues, also with copies of the images, is to be

The strangeness of these tracings is in that they exhibit the outlines of a man stretched out on a cross, by a series of drawings, by which from the form of a *man* that of a *cross* springs, but so done that the cross may be taken as the man, or the man as the cross; thus exhibiting a symbolic display of the interdependency of the forms set forth in the text.” — p. 54

However, it is remarkable on one account: it is built entirely of hewn stones, of an extraordinary size, and very beautifully shaped. *Three* staircases lead to the top, the steps of which were decorated with hieroglyphical sculptures and small *niches*, arranged with great symmetry. Blavatsky, *Isis Unveiled*, 1877: “Brahma, the fire-god, and his prolific consort; and the Hindu *Unghi* [*Agni*], the refulgent deity, from whose body issue a thousand streams of glory and *seven* tongues of flame, and in whose honor the Sagniku Brahmans preserve to this day a *perpetual* fire; Siva, personated by the mundane mountain of the Hindus — the *Meru* (Himalaya). This terrific fire-god, who is said in the legend to have descended from heaven, like the Jewish Jehovah, *in a pillar of fire*, and a dozen other archaic, double-sexed deities, all loudly proclaim their hidden meaning.” — 1:156

“And what can these dual myths mean . . .”

p/q: H. P. Blavatsky, *Isis Unveiled*, 1877: “And what can these dual myths mean but the physico-chemical principle of primordial creation? The first revelation of the Supreme Cause in its triple manifestation of spirit, force, and matter; the divine *correlation*, at its starting-point of evolution, allegorized as the marriage of *fire* and water, products of electrifying spirit, union of the male active principle with the female passive element, which become parents of their tellurian child, cosmic matter, the *prima materia*, whose spirit is ether, the ASTRAL LIGHT!” — 1:156

“The existence of spirit in the common mediator . . .”

p/q: H. P. Blavatsky, *Isis Unveiled*, 1877: “The existence of spirit in the common mediator, the ether, is denied by materialism; while theology makes of it a personal god, the kabalist holds that both are wrong, saying that in ether, the elements represent but matter — the blind cosmic forces of nature; and Spirit, the intelligence which directs them. The Hermetic, Orphic, and Pythagorean cosmological doctrines, as well as those of Sanchoniathon and Berosus, are all based upon one irrefutable formula, viz.: that the ether and chaos, or, in the Platonic language, mind and matter, were the two primeval and eternal principles of the universe, utterly independent of anything else. The former was the all-vivifying intellectual principle; the chaos, a shapeless, liquid principle, without ‘form or sense,’ from the union of which two, sprung into existence the universe, or rather, the universal world, the first androgynous deity — the chaotic matter becoming its body, and ether the soul.” — 1:341

In the Chaldean legend of Berossus, Oannes or Dagon, the man-fish, instructing the people, shows the infant world created out of *water* and all beings originating from this *prima materia*. Moses teaches that only earth and *water* can bring a living soul; and we read in the Scriptures that herbs could not grow until the Eternal caused it to *rain* upon earth. In the Mexican *Popol-Vuh* man is created out of *mud* or clay (*terre glaise*), taken from under the water.” — 1:133

“Brahmā creates the great Muni (or first man) . . .”

p/q: H. P. Blavatsky, *Isis Unveiled*, 1877: “Brahma creates . . . the great Muni (or first man), seated on his lotus, only after having called into being, *spirits*, who thus enjoyed among mortals a priority of existence, and he creates him out of water, air, and earth. Alchemists claim that primordial or pre-Adamic earth when reduced to its first substance is in its *second* stage of transformation like clear-water, the first being the *alkahest* proper. This primordial substance is said to contain within itself the essence of all that goes to make up man; it has not only all the elements of his physical being, but even the ‘breath of life’ itself in a latent state, ready to be awakened. This it derives from the ‘incubation’ of the Spirit of God upon the face of the waters — chaos; in fact, this substance is chaos itself. From this it was that Paracelsus claimed to be able to make his ‘homunculi’; and this is why Thales, the great natural philosopher, maintained that *water* was the principle of all things in nature.” — 1:133-4

The inhabitants of the two (upper) spheres . . . remove to (the sphere above, or) Mahar-loka {Those . . . distinguished for piety, abide, at the time of dissolution, in Mahar-loka, with the Pitris, the Manus, the seven Rishis, the various orders of celestial spirits, and the gods}.” — 5(I):192-3 & fns. (vi.3)

p/q: *Vishṇu Purāṇa*, tr. Wilson, ed. Hall, 1864-77: “These, when the heat of the flames that destroy the world reaches to Mahar-loka, repair to Jana-loka, in their subtle forms, destined to become reembodyed, in similar capacities as their former, when the world is renewed, at the beginning of the succeeding Kalpa.” — 5(I):193 fn. (*Vāyu Purāṇa*)

“These clouds, mighty in size . . .”

p/q: *Vishṇu Purāṇa*, tr. Wilson, ed. Hall, 1864-77: “Mighty in size, and loud in thunder, they fill all space {*Nabhas-tala*}. Showering down torrents of water, these clouds quench the dreadful fires . . . and then they rain, uninterruptedly, for a hundred years, and deluge the whole world. Pouring down, in drops as large as dice, these rains overspread the earth, and fill the middle region {*Bhuvo-loka*}, and inundate heaven. The world is now enveloped in darkness; and all things animate or inanimate, having perished, the clouds continue to pour down their waters . . .” — 5(I):194 & fns. (vi.3)

When the waters have reached the region of the Seven Rishis . . .

p/q: *Vishṇu Purāṇa*, tr. Wilson, ed. Hall, 1864-77: “When the waters have reached the region of the seven Rishis, and the whole of the three worlds is one ocean, they stop. The breath of Vishṇu becomes a (strong) wind, which blows for more than a hundred years, until all the clouds are dispersed. The wind is then reabsorbed; and he of whom all things are made, the lord by whom all things exist, he who is inconceivable, without beginning, beginning of the universe, reposes, sleeping upon Śesha, in the midst of the deep.” — 5(I):195 (vi.4)

— 371-2 —

The Adikrit (Creator?) Hari, sleeps upon the ocean of Space . . .

p/q: *Vishṇu Purāṇa*, tr. Wilson, ed. Hall, 1864-77: “The creator {*Ādikṛit*}, Hari, sleeps (upon the ocean), in the form of Brahmā — glorified by Sanaka and the saints {*Siddha*} who had gone to the Jana-

loka, and contemplated by the holy inhabitants of Brahma-loka, anxious for final liberation, — involved in mystic slumber, the celestial personification of his own illusions . . .” — 5(I):195 & fns. (vi.4)

— 372 —

This is the *Pratisanchara* (dissolution?) termed incidental . . .

¶/Q: *Vishṇu Purāṇa*, tr. Wilson, ed. Hall, 1864-77: “This . . . is the dissolution {*Pratisanchara*} termed incidental; because Hari, in the form of Brahmā, sleeps there, as its incidental cause.” — 5(I):196 & fn. (vi.4)

When the Universal Spirit wakes . . .

¶/Q: *Vishṇu Purāṇa*, tr. Wilson, ed. Hall, 1864-77: “When the universal spirit wakes, the world revives; when he closes his eyes, all things fall upon the bed of mystic slumber. In like manner as a thousand great ages constitute a day of Brahmā {the original has Padmayoni, the same as Abjayoni}, so his night consists of the same period . . . Awaking at the end of his night, the unborn . . . creates the universe anew . . .” — 5(I):196 & fn. (vi.4)

“When by dearth and fire . . .”

¶/Q: *Vishṇu Purāṇa*, tr. Wilson, ed. Hall, 1864-77: “When, by dearth and fire, all the worlds and Pātālas are withered up . . . the progress of elemental dissolution is begun. Then, first, the waters swallow up the property of earth (which is the rudiment of smell); and earth, deprived of its property, proceeds to destruction. . . . the earth becomes one with water. . . . When the universe is, thus, pervaded by the waves of the watery element, its rudimentary flavour is licked up by the element of fire; and in consequence . . . the waters themselves are destroyed. . . . they become one with fire; and the universe is, therefore, entirely filled with flame, which . . . gradually overspreads the whole of the world.” — 5(I):196-7 (vi.4)

“While Space is one flame . . .”

¶/Q: *Vishṇu Purāṇa*, tr. Wilson, ed. Hall, 1864-77: “While space is enveloped in flame, above, below, and all around, the element of wind seizes upon the rudimental property, or form, which is the cause of light; and, that being withdrawn {*Pralīna*}, all becomes of the nature of air. The rudiment of form being destroyed, and fire {*Vibhāvasu*} deprived of its rudiment, air extinguishes fire, and spreads . . . over space, which is deprived of light, when fire merges into air. Air, then, accompanied by sound, which is the source of ether, extends everywhere throughout the ten regions of space, until ether seizes upon contact {*Sparśa*}, its rudimental property, by the loss of which, air is destroyed, and ether {*Kha*} remains unmodified: devoid of form, flavour, touch {*Sparśa*}, and smell, it exists unembodied {I find no reading but *mūrttimat*, which means ‘embodied’} and vast, and pervades the whole of space.” — 5(I):197-8 & fns. (vi.4)

— 372-3 —

“Akāśa, whose characteristic property . . .”

¶/Q: *Vishṇu Purāṇa*, tr. Wilson, ed. Hall, 1864-77: “Ether {*Ākāśa*}, whose characteristic property and rudiment is sound, exists alone, occupying all the vacuity of space. But then the radical element {*Bhūtādi*} . . . devours sound; and all the elements and faculties are, at once, merged into their original.” — 5(I):198 & fns. (vi.4)

— 373 —

“The primary Element, Consciousness, combined with *tamasa* . . .”

¶/Q: *Vishṇu Purāṇa*, tr. Wilson, ed. Hall, 1864-77: “This primary element is consciousness, combined

with the property of darkness {*tāmasa*}, and is, itself, swallowed up by Mahat, whose characteristic property is intelligence {*Buddhi*}; and earth and Mahat are the inner and outer boundaries of the universe. In this manner . . . were the seven forms of nature (Prakṛiti), reckoned from Mahat to earth — so, at the (time of elemental) dissolution, these seven successively re-enter into each other.” — 5(I):198-9 & fns. (vi.4)

“The Egg of Brahmā (*Sarva-maṇḍala*) is dissolved . . .”

p/q: *Vishṇu Purāṇa*, tr. Wilson, ed. Hall, 1864-77: “The egg of Brahmā {*Sarva-maṇḍala*} is dissolved in the waters that surround it, with its seven zones {*Dwīpa*}, seven oceans, seven regions, and their mountains. The investiture of water is drunk up by fire; the (stratum of) fire is absorbed by (that of) air; air blends itself with ether; the primary element {*Bhūtādi*} . . . devours the ether, and is (itself,) taken up by intellect {*Mahat*}, which along with all these, is seized upon by nature (Prakṛiti).” — 5(I):199 & fns. (vi.4)

“The Prakṛiti is essentially the same . . .”

p/q: *Vishṇu Purāṇa*, tr. Wilson, ed. Hall, 1864-77: “This Prakṛiti is, essentially, the same, whether discrete or indiscrete; only that which is discrete is, finally, lost or absorbed in the indiscrete. Spirit {*Puṃs*}, also, which is one, pure, imperishable, eternal, all-pervading, is a portion of that supreme spirit which is all things. That spirit {*Sarveśa*} which is other than (embodied) spirit, in which there are no attributes of name, species {*Nāman* and *jāti*} . . . which is one with (all) wisdom, and is to be understood as (sole) existence {*Sattā*} . . . Nature (Prakṛiti) . . . and spirit {*Puruṣa*} . . . both resolve into supreme spirit.” — 5(I):199-200 & fns. (vi.4)

“The man in the moon . . . is often charged with bad conduct . . .”

r/q: Gerald Massey, *Luniolatry; Ancient and Modern*, 1887: “The Man in the moon is often charged with bad conduct towards his mother, sister, mother-in-law, or some other near female relation, on account of the natural origin in lunar phenomena. In these the moon was one as *the* moon, which was two-fold in sex, and three-fold in character, as mother, child, and adult male. Thus the child of the moon became the consort of his own mother! It could not be *helped* if there was to be any reproduction. He was compelled to be his own father!” — p. 23

“These relationships were repudiated by later sociology . . .”

r/q: Gerald Massey, *Luniolatry; Ancient and Modern*, 1887: “These relationships were repudiated by later sociology, and the primitive man in the moon got tabooed. Yet, in its latest, most inexplicable phase, this has become the central doctrine of the grossest superstition the world has ever seen, for these lunar phenomena and their humanly represented relationships, the incestuous included, are the very foundations of the Christian Trinity in Unity. Through ignorance of the symbolism, the simple representation of early time has become the most profound religious mystery in modern Luniolatry.” — p. 23

“The Roman Church, without being in any wise ashamed of the proof . . .”

r/q: Gerald Massey, *Luniolatry; Ancient and Modern*, 1887: “The Roman Church, without being in any wise ashamed of the proof, portrays the Virgin Mary arrayed with the Sun, and the horned moon at her feet, holding the lunar infant in her arms — as child and consort of the mother moon! The mother, child, and adult male, are fundamental . . . In this way it can be proved that our Christology is mummified mythology, and legendary lore, which have been palmed off upon us in the *Old* Testament and the *New*, as divine revelation uttered by the very voice of God.” — p. 23

Parabrahmam . . . “Is not Ego, it is not non-ego . . . it is not even *Atma*”

p/q: T. Subba Row, “Notes on the Bhagavad Gita — I,” Feb. 1887: “Again it is not even *atma*. . . . But *Parabrahmam* . . . is not ego, it is not non-ego, nor is it consciousness . . .” — p. 302 (*The Theosophist*, v. 8)

“but though not itself an object of knowledge . . .”

p/q: T. Subba Row, “Notes on the Bhagavad Gita — I,” Feb. 1887: “. . . the foundation of all phenomena is *Parabrahmam*, which, though not itself an object of knowledge, is yet capable of supporting and giving rise to every kind of object and every kind of existence which becomes an object of knowledge. Now this *Parabrahmam* . . . is the one essence from which starts into existence a centre of energy, which I shall for the present call the *Logos*.” — p. 303 (*The Theosophist*, v. 8)

This Logos is the *Sabda Brahman* of the Hindus . . .

SEE: T. Subba Row, “Notes on the Bhagavad Gita — I,” Feb. 1887: “This *Logos* may be called in the language of old writers either *Eswara* or *Pratyagatma* or *Sabda Brahman*.” — p. 303 (*The Theosophist*, v. 8)

“This Ego . . . is the first that appears in Kosmos . . .”

p/q: T. Subba Row, “Notes on the Bhagavad Gita — I,” Feb. 1887: “. . . this is the first manifestation of *Parabrahmam*, the first ego that appears in the cosmos, the beginning of all creation and the end of all evolution. . . . When once this ego starts into existence as a conscious being having objective consciousness of its own . . . *Parabrahmam* appears to it as *Mulaprakriti*. Please bear this in mind . . . for here is the root of the whole difficulty about *Purusha* and *Prakriti* felt by various writers on Vedantic philosophy.” — p. 304 (*The Theosophist*, v. 8)

“This *Mulaprakriti* is material to it . . .”

p/q: T. Subba Row, “Notes on the Bhagavad Gita — I,” Feb. 1887: “Of course this *Mulaprakriti* is material to it, as any material object is material to us. This *Mulaprakriti* is no more *Parabrahmam* than the bundle of attributes of this pillar is the pillar itself; *Parabrahmam* is an unconditioned and absolute reality, and *Mulaprakriti* is a sort of veil thrown over it. *Parabrahmam* by itself cannot be seen as it is. It is seen by the *Logos* with a veil thrown over it, and that veil is the mighty expanse of cosmic matter.” — p. 304 (*The Theosophist*, v. 8)

AIN-SOPH . . . could not be comprehended, nor named, though the causeless cause of all

p/q: J. Ralston Skinner, “The Cabbalah — No. VI,” June 1886: “. . . the wise men who enunciated the Cabbalah dealt first with the fact of a *primal intelligence* . . . This intelligence, they declared, could not

be comprehended at all, — could not be located, — could not be named, though the cause of all.” — p. 257 (*Masonic Review*, 65:5)

Hence its name — AIN-SOPH — is a term of negation, “the inscrutable, the incognizable . . .”

p/q: J. Ralston Skinner, “The Cabbalah — No. VI,” June 1886: “They, therefore, designated it by a term of negation, and called it the Ain Soph, — the inscrutable, the unknowable, the unnameable.” — p. 257 (*Masonic Review*, 65:5)

“Close your eyes, and from your own consciousness of perception . . .”

p/q: J. Ralston Skinner, “The Cabbalah — No. VI,” June 1886: “Close your eyes, and from your own consciousness of perception try and think outward to the extremest limits, in every direction. You will find that equal lines or rays of perception extend out evenly in all directions; so that the utmost effort of perception will terminate in *the vault of a sphere*. The limitation of this sphere will, of necessity, be a *great circle*, and the direct rays of thought in any and every direction must be *right line radii* of the circle.” — p. 257 (*Masonic Review*, 65:5)

“This, then, *must* be, humanly speaking, the extremest all-embracing conception . . .”

p/q: J. Ralston Skinner, “The Cabbalah — No. VI,” June 1886: “This, then, *must* be, humanly speaking, the extremest all-embracing conception of the Ain Soph *manifest*; — which formulates itself as a *geometrical figure*, viz.: of a circle, with its elements, of curved circumference and right line diameter divided into radii. Hence, a geometrical shape is the first recognizable mean of connection between the Ain Soph and the intelligence of man.” — pp. 257-8 (*Masonic Review*, 65:5)

Mor Isaac . . . shows the ancient Syrians defining their world of the “Rulers” . . .

SEE: J.-E. de Mirville, *Des Esprits*, 1863-8: “Les Syriens définissaient à peu près de la même manière leurs dix mondes séphirothiques {Mor Isaac, cité par le père Kircher, *Œdipus*, t. II, p. 425} [The Syrians defined, in almost the same way, their ten sephirothal worlds {Mor Isaac, cited by Father Kircher, *Œdipus*, v. 2, p. 425}] . . .” — 4:10, 11 fn.

The lowest world was the SUBLUNARY . . . watched by the “Angels” . . .

SEE: J.-E. de Mirville, *Des Esprits*, 1863-8: “. . . le premier (celui de la lune) était assigné aux simples anges du premier chœur; le second (celui de Mercure) appartenait aux archanges; le troisième (celui de Vénus), aux principautés [the first (that of the moon) was assigned to the simple angels of the first order; the second (that of Mercury), belonged to the Archangels; the third (that of Venus), to the Principalities] . . .” — 4:10

the fourth was that of the SUN . . .

SEE: J.-E. de Mirville, *Des Esprits*, 1863-8: “. . . le quatrième (celui du Soleil), aux grandes puissances; le cinquième (celui de Mars), aux vertus; le sixième (celui de Jupiter ou Bel), aux dominations; le septième (celui de Saturne), aux trônes [the fourth (that of the Sun), was assigned to the great Powers; the fifth (that of Mars), to the Virtues; the sixth (that of Jupiter or Bel), to the Dominions; the seventh (that of Saturn), to the Thrones] . . .” — 4:10

The eighth . . . is the domain of the *Cherubs*; the ninth, belonging to the . . . numberless stars . . .

p/q: J.-E. de Mirville, *Des Esprits*, 1863-8: “. . . le huitième (composé de onze cent vingt-deux étoiles), aux chérubins; le neuvième (étoiles *marchantes*, mais innombrables, en raison de leur hauteur), aux séraphins [the eighth (made up of 1,122 stars), to the cherubs; the ninth (the *moving* stars, which are numberless, on account of their distance), to the Seraphs] . . .” — 4:10

p/q: Gaston Maspero, *Guide du Visiteur au Musée de Boulaq*, 1883: “ ‘Salut à toi, Osiris, fils aîné de Sib, le plus grand des six dieux issus de la déesse Nout, le grand favori de son père Rā, le père des pères . . . roi du temps, maître de l’éternité . . . dès qu’il sortit du sein de sa mère, il réunit le[s] couronnes, il attacha l’uræus sur sa tête; multiforme, dieu dont le nom est inconnu, et qui a beaucoup de noms dans les villes et dans les provinces’ [‘Salutations to you, Osiris, elder son of Sib, the greatest of the six gods emanated from the goddess Nūt, the great favorite of his father Rā, father of fathers . . . king of duration, master of eternity . . . as soon as he issued from his mother’s bosom, he reunited the crowns, he fastened the uræus to his head; multiform, god whose name is unknown, and who has many names in the towns and provinces’] . . .” — pp. 49-50 (*Abydos*)

the archangel “whose name was secret”

SEE: *The Book of Enoch*, tr. R. Laurence, 1883: “. . . the principal part of the oath which the Most High, dwelling in glory, revealed to the holy ones. . . . He spoke to holy Michael to discover to them the sacred name, that they might understand that secret name, and thus remember the oath . . . And he established this oath of Akæ by the instrumentality of the holy Michael.” — p. 86 (lxviii.19-22)

This Archangel was the representative on earth of the *Hidden Jewish God*

SEE: Paul Carus, “Yin Chih Wen,” May 1906: “Michael means literally ‘who is like God,’ and seems to designate that divine presence (viz. the ineffable name) which is believed to be equal to God . . . Michael, according to the angel lore of the Hebrews, is the representative of God, and so he is identified with God’s cause. He is the guardian angel of Israel . . .” — p. 263 (*Open Court*, v. 20)

it is his “Face” that is said to have gone before the Jews like a “Pillar of Fire”

SEE: *The Interlinear Bible*, 1906: “And the LORD went before them by day in a pillar of a cloud, to lead them the way; and by night in a pillar of fire, to give them light . . .” — p. 89 (*Exodus*, 13:21)

“And the angel of God, which went before the camp of Israel, removed and went behind them; and the pillar of the cloud went from before their face, and stood behind them: and . . . it gave light by night . . .” — p. 90 (*Exodus*, 14:19-20)

“Thou art one, the beginning of all numbers . . .”

p/q: *Royal Masonic Cyclopaedia*, ed. Kenneth R. H. Mackenzie, 1877: “Thou art One, the beginning of all numbers, and the foundation of all edifices; Thou art One, and in the secret of Thy Unity, the wisest of men are lost, because they know it not. Thou art One, and thy Unity is never diminished, never extended, and cannot be changed. Thou art One, but not as an element of numeration; for Thy Unity admits not of multiplication, change, or form.” — 1:261

“Thou art existent . . .”

p/q: *Royal Masonic Cyclopaedia*, ed. Kenneth R. H. Mackenzie, 1877: “Thou art Existent; but the understanding and vision of mortals cannot attain to Thy existence, nor determine for Thee the Where, the How, and the Why. Thou art Existent, but in Thyself alone, there being none other that can exist with Thee. Thou art Existent, before all Time and without Place. Thou art Existent, and Thy Existence is so secret and profound that none can penetrate or discover Thy secrecy. Thou art Living, but within no time which can be known and fixed; Thou art Living, but not by a spirit or a soul, for Thou art Thyself, the Soul of all souls.” — 1:261

Or dès le premier examen des systèmes particuliers proposés, on éprouve la plus étrange déception; on s’aperçoit que l’atome du chimiste, celui du physicien, celui du métaphysicien, celui du mathématicien . . . n’ont absolument de commun que le nom! metaphysician, and that of the mathematician . . . have absolutely nothing in common but their name].’ ”

All have believed themselves successful, and have formulated their results with great confidence. “At this moment, when the theory of mere motion . . .”

p/Q: B. W. Richardson, “Sun Force and Earth Force,” 1866: “At this moment, when the theory of mere motion as the origin of all varieties of force is again becoming the prevailing thought, it were almost heresy to re-open a debate, which for a period appears, by general consent, to be virtually closed; but I accept the risk, and shall state, therefore, what were the precise views of the immortal heretic, whose name I have whispered to the reader, respecting sun force. Starting with the argument on which nearly all physicists are agreed, that there exists in nature two agencies, matter which is ponderable, visible, and tangible, and a something which is imponderable, invisible, and appreciable only by its influence on matter, Metcalfe maintains that the imponderable and active agency, which he calls ‘caloric,’ is not a mere form of motion, not a vibration amongst the particles of ponderable matter, but

itself a material substance flowing from the sun through space, filling the voids between the particles of solid bodies and conveying by sensation the property called heat.” — pp. 329-30 (*Popular Science Review*, v. 5)

“The nature of caloric, or Sun-Force, is contended for by him on the following grounds . . .”

p/q: B. W. Richardson, “Sun Force and Earth Force,” 1866: “The material nature of caloric, or sun force, is contended for by him on the following grounds:

1. That it may be added to, and abstracted from, other bodies, and measured with mathematical precision.
2. That it augments the volume of bodies which are again reduced in size by its abstraction.
3. That it modifies the forms, properties, and conditions of all other bodies.
4. That it passes by radiation through the most perfect vacuum that can be formed, in which it produces the same effects on the thermometer as in the atmosphere.
5. That it exerts mechanical and chemical forces which nothing can restrain, as in volcanos, the explosion of gunpowder and other fulminating compounds.
6. That it operates in a sensible manner on the nervous system, producing intense pain; and, when in excess, disorganization of the tissues.” — p. 330 (*Popular Science Review*, v. 5)

“As against the vibratory theory, Metcalfe further argues . . .”

p/q: B. W. Richardson, “Sun Force and Earth Force,” 1866: “As against the vibratory theory, Metcalfe further argues that, if caloric were a mere property or quality, it could not augment the volume of other bodies; for this purpose it must itself have volume, it must occupy space; and it must, therefore, be a material agent. If caloric were only the effect of vibratory motion amongst the particles of ponderable matter, it could not radiate from hot bodies without the simultaneous transition of the vibrating particles . . .” — p. 330 (*Popular Science Review*, v. 5)

“With this view as to the material nature of caloric . . .”

p/q: B. W. Richardson, “Sun Force and Earth Force,” 1866: “With this view as to the material nature of caloric, or sun force; with the impression firmly fixed on his mind that ‘everything in nature is composed of two descriptions of matter, the one essentially active and ethereal, the other passive and motionless,’ Metcalfe based the hypothesis that the sun force, or caloric, is a self-active principle. For its own particles, he holds, it has repulsion; for the particles of all ponderable matter it has affinity; it attracts the particles of ponderable matter with forces which vary inversely as the squares of the distance. It thus acts *through* ponderable matter.” — p. 330-1 (*Popular Science Review*, v. 5)

“If universal space were filled with caloric . . .”

p/q: B. W. Richardson, “Sun Force and Earth Force,” 1866: “If universal space were filled with caloric, sun force, alone (without ponderable matter), caloric would also be inactive, and would constitute a boundless ocean of powerless or quiescent ether, because it would then have nothing on which to act; while ponderable matter, however inactive of itself, ‘has certain properties by which it modifies and controls the actions of caloric, both of which are governed by immutable laws that have

their origin in the mutual relations and specific properties of each.’ ” — p. 331 (*Popular Science Review*, v. 5)

“And he lays down a law . . .”

p/q: B. W. Richardson, “Sun Force and Earth Force,” 1866: “And he lays down a law which he believes is absolute, and which is thus expressed: — ‘By the attraction of caloric for ponderable matter it unites and holds together all things; by its self-repulsive agency it separates and expands all things.’ ” — p. 331 (*Popular Science Review*, v. 5)

“As I have already said, the tendency of modern teaching . . .”

p/q: B. W. Richardson, “Sun Force and Earth Force,” 1866: “As I have already said, the tendency of modern teaching is to rest upon the hypothesis . . . that heat is motion, or, as it would perhaps be better stated, a specific force or form of motion.

But this hypothesis, popular as it is, is not one that ought to be accepted to the exclusion of the simpler view of the material nature of sun force and of its influence in modifying the condition of matter. We do not yet know sufficient to be dogmatic . . .” — p. 331 (*Popular Science Review*, v. 5)

— 525-6 —

“The hypothesis of Metcalfe . . .”

p/q: B. W. Richardson, “Sun Force and Earth Force,” 1866: “. . . the hypothesis of Metcalfe respecting sun force and earth force is not only very simple, but most fascinating. . . Here are two elements in this universe: the one is ponderable matter . . . The second element is the all-pervading ether, solar fire. It is without weight, substance, form, or colour; it is matter infinitely divisible and its particles repel each other; its rarity is such that we have no word except ether by which to express it. It pervades and fills space, but alone it too is quiescent — dead.” — pp. 331-2 (*Popular Science Review*, v. 5)

— 526 —

“We bring together the two elements . . .”

SEE: B. W. Richardson, “Sun Force and Earth Force,” 1866: “We bring together the two elements, the inert matter, the self-repulsive ether, and thereupon the dead ponderable matter is vivified: through the particles of the ponderable substance the ether penetrates, and so penetrating, it combines with the ponderable particles and holds them in mass, holds them together in one bond of union; they are dissolved in the ether.” — p. 332 (*Popular Science Review*, v. 5)

“This distribution of solid ponderable matter . . .”

p/q: B. W. Richardson, “Sun Force and Earth Force,” 1866: “This distribution of solid ponderable matter through ether extends, according to the theory before us, to everything that exists at this moment. The ether is all-pervading. The human body itself is charged with the ether; its minute particles are held together by it: the plant is in the same condition; the most solid earth, rock, adamant, crystal, metal, all the same.

But there are differences in the capacities of different kinds of ponderable matter to receive sun force, and upon this depends the various changing conditions of matter; the solid, the liquid, the gaseous condition. Solid bodies have attracted caloric in excess over fluid bodies and hence their firmer cohesion: when a portion of molten zinc is poured upon a plate of solid zinc, the molten zinc becomes solid, because there is a rush of caloric from the liquid to the solid, and in the equalization the particles previously loose or liquid are more closely brought together . . .” — p. 332 (*Popular Science Review*, v. 5)

“Metcalfe himself, dwelling on the above-named phenomena . . .”

p/q: B. W. Richardson, “Sun Force and Earth Force,” 1866: “Metcalf himself, dwelling on the above-named phenomena and accounting for them by the unity of principle of action which has already been explained, sums up his argument in very clear terms, in a comment on the densities of various bodies.

‘Hardness and softness, solidity and liquidity, are not essential conditions of bodies, but depend on the relative proportions of ethereal and ponderable matter of which they are composed. The most elastic gas may be reduced to the liquid form by the abstraction of caloric, and again converted into a firm solid, the particles of which would cling together with a force proportional to their augmented affinity for caloric. On the other hand, by adding a sufficient quantity of the same principle to the densest metals, their attraction for it is diminished when they are expanded into the gaseous state, and their cohesion is destroyed.’ ” — p. 333 (*Popular Science Review*, v. 5)

“I shall not dwell at great length on this unity . . .”

p/q: B. W. Richardson, “Sun Force and Earth Force,” 1866: “I shall not dwell at greater length on the unity of sun force and earth, which this theory implies. But I may add that out of it or out of the hypothesis of mere motion as force and of virtue without substance, we may gather as the nearest possible approach to the truth, on this, the most complex and profound of all subjects, the following inferences: — (a) Space inter-stellary, inter-planetary, inter-material, inter-organic, is not a vacuum, but is filled with a subtle fluid or gas, which for want of a better term we may call still, as the ancients did, Aith-Ur — Solar fire, ÆTHER. This fluid, unchangeable in composition, indestructible, invisible, pervades everything, and all matter; the pebble in the running brook, the tree over-hanging, the man looking on, is charged with this ether in various degree: the pebble less than the tree, the tree less than the man. All the planet in like manner is so charged! A world built up in ethereal fluid and moving through a sea of it.” — p. 333 (*Popular Science Review*, v. 5)

“The Ether, whatever its nature is . . .”

p/q: B. W. Richardson, “Sun Force and Earth Force,” 1866: “(b) The ether, whatever its nature, is from the sun and from the suns; the suns are the generators of it, the store-houses of it, the diffusers of it. (c) Without the ether there could be no motion; without it particles of ponderable matter could not glide over each other; without it there could be no impulse to excite those particles into action. (d) Ether determines the constitution of bodies. Were there no ether, there could be no change of constitution of substance: water, for example, could only exist as a substance, compact and insoluble beyond any conception we could form of it. It could never even be ice, never fluid, never vapour, except for ether. (e) Ether connects sun with planet, planet with planet, man with planet, man with man. Without ether there could be no communication in the universe: no light, no heat, no phenomenon of motion.” — pp. 333-4 (*Popular Science Review*, v. 5)

Richardson, “Theory of a Nervous Ether,” 1871: “It may be urged that in this line of thought is included no more than the theory of the existence of the ether that is supposed to pervade space, the undulating ether of light. It may be said that this universal ether pervades all the organism of the animal body as from without, and as part of every organisation. This view would be Pantheism physically discovered, if it were true. It fails to be true because it would destroy the individuality of every individual being: it fails to be true because it would destroy the individuality of every individual sense.” — p. 384 (*Popular Science Review*, v. 10)

p/q: William Crookes, “Elements and Meta-Elements,” March 28, 1888: “Permit me, gentlemen, now to draw your attention for a short time to a subject which concerns the fundamental principles of chemistry, a subject which may lead us to admit the possible existence of bodies which, though neither compounds nor mixtures, are not elements in the strictest sense of the word; — bodies which I venture to call ‘meta-elements.’ ” — p. 206 (*Chemical News*, May 25, 1888)

“To explain my meaning it is necessary . . .”

p/q: William Crookes, “Elements and Meta-Elements,” March 28, 1888: “To explain my meaning it is necessary for me to revert to our conception of an element. What is the criterion of an element? Where are we to draw the line between distinct existence and identity? No one doubts that oxygen, sodium, chlorine, sulphur, are separate elements; and when we come to such groups as chlorine, bromine, iodine, &c., we still feel no doubt, although were degrees of ‘elementicity’ admissible — and to that we may ultimately have to come — it might be allowed that chlorine approximates much more closely to bromine than to oxygen, sodium, or sulphur. Again, nickel and cobalt are near to each other, very near, though no one questions their claim to rank as distinct elements.” — p. 206 (*Chemical News*, May 25, 1888)

p/q: William Crookes, “Elements and Meta-Elements,” March 28, 1888: “Still I cannot help asking what would have been the prevalent opinion among chemists had the respective solutions of these bodies and their compounds presented identical colours, instead of colours which, approximately speaking are mutually complementary? Would their distinct nature have even now been recognised?” — p. 206 (*Chemical News*, May 25, 1888)

“When we pass further . . .”

p/q: William Crookes, “Elements and Meta-Elements,” March 28, 1888: “When we pass further and come to the so-called rare earths the ground is less secure under our feet. Perhaps we may admit scandium, ytterbium, and others of the like sort to elemental rank; but what are we to say in the case of praseo- and neo-dymium, between which there may be said to exist no well-marked chemical difference, their chief claim to separate individuality being slight differences in basicity and crystallising powers, though their physical distinctions as shown by spectrum observations are very strongly marked? Even here we may imagine the disposition of the majority of chemists would incline towards the side of leniency, so that they would admit these two bodies within the charmed circle. Whether in so doing they would be able to appeal to any broad principle is an open question.” — pp. 206-7 (*Chemical News*, May 25, 1888)

Here the spectral differences are well marked, whilst my own researches on didymium show also a slight difference in basicity between some at least of these doubtful bodies.” — p. 207 (*Chemical News*, May 25, 1888)

“In the same category must be included the numerous separate bodies . . .”

p/q: William Crookes, “Elements and Meta-Elements,” March 28, 1888: “In the same category must

be included the numerous separate bodies into which it is probable that yttrium, erbium, samarium, and other ‘elements’ — commonly so-called — have been and are being split up. Where then are we to draw the line? The different groupings shade off so imperceptibly the one into the other that it is impossible to erect a definite boundary between any two adjacent bodies and to say that the body on this side of the line is an element, whilst the one on the other side is non-elementary, or merely something which simulates or approximates to an element.” — p. 207 (*Chemical News*, May 25, 1888)

“Wherever an apparently reasonable line might be drawn . . .”

p/q: William Crookes, “Elements and Meta-Elements,” March 28, 1888: “Wherever an apparently reasonable line might be drawn it would no doubt be easy at once to assign most bodies to their proper side, as in all cases of classification the real difficulty comes in when the border-line is approached. Slight chemical differences of course are admitted, and, up to a certain point, so are well-marked physical differences. What are we to say, however, when the only chemical difference is an almost imperceptible tendency for the one body — of a couple or of a group — to precipitate before the other? Again, there are cases where the chemical differences reach the vanishing point, although well-marked physical differences still remain.” — p. 207 (*Chemical News*, May 25, 1888)

“Here we stumble on a new difficulty . . .”

p/q: William Crookes, “Elements and Meta-Elements,” March 28, 1888: “Here we stumble on a new difficulty: in such obscurities what is chemical and what is physical? Are we not entitled to call a slight tendency of a nascent amorphous precipitate to fall down in advance of another a ‘physical difference?’ And may we not call coloured reactions depending on the amount of some particular acid present, and varying according to the concentration of the solution and to the solvent employed, ‘chemical differences?’ I do not see how we can deny elementary character to a body which differs from another by well-marked colour or spectrum-reactions whilst we accord it to another body whose only claim is a very minute difference in basic powers.” — p. 207 (*Chemical News*, May 25, 1888)

“Having once opened the door wide enough . . .”

p/q: William Crookes, “Elements and Meta-Elements,” March 28, 1888: “Having once opened the door wide enough to admit some spectrum differences, we have now to enquire how minute a difference qualifies the candidate to pass? I will give instances from my own experience of some of these doubtful candidates.” — p. 207 (*Chemical News*, May 25, 1888)

“periodic theory” stands in the way of an unlimited multiplication of elements

SEE: William Crookes, “Elements and Meta-Elements,” March 28, 1888: “The real difficulty we encounter by unlimited multiplication of elements arises from the Periodic theory. That theory has received such abundant verification that we cannot lightly accept any interpretation of phenomena which fails to be in accordance with it.” — p. 207 (*Chemical News*, v. 57)

— 547-8 —

“That theory has received such abundant verification . . .”

p/q: William Crookes, “Elements and Meta-Elements,” March 28, 1888: “That theory has received such abundant verification that we cannot lightly accept any interpretation of phenomena which fails to be in accordance with it. But if we suppose the elements reinforced by a vast number of bodies slightly differing from each other in their properties, and forming, if I may use the expression, aggregations of nebulæ where we formerly saw, or believed we saw, separate stars, the periodic arrangement can no longer be definitely grasped. No longer, that is, if we retain our usual conception of an element. Let us then modify this conception. For ‘element’ read ‘elementary group,’ such elementary groups taking the place of the old elements in the periodic scheme, — and the difficulty falls away.” — p. 207 (*Chemical*

“In defining an element . . .”

p/q: William Crookes, “Elements and Meta-Elements,” March 28, 1888: “In defining an element, let us take not an external boundary, but an internal type. Let us say, *e.g.*, the smallest ponderable quantity of yttrium is an assemblage of ultimate atoms almost infinitely more like each other than they are to the atoms of any other approximating element. It does not necessarily follow that the atoms shall all be absolutely alike among themselves. The atomic weight which we ascribe to yttrium, therefore, merely represents a mean value around which the actual weights of the individual atoms of the ‘element’ range within certain limits. But if my conjecture is tenable, could we separate atom from atom, we should find them varying within narrow limits on each side of the mean. The very process of fractionation implies the existence of such differences in certain bodies.” — p. 207 (*Chemical News*, May 25, 1888)

“Until lately such bodies passed muster as elements. . . .”

p/q: William Crookes, “Elements and Meta-Elements,” March 28, 1888: “Until lately such bodies passed muster as elements. They had definite properties, chemical and physical; they had recognised atomic weights. If we take a pure dilute solution of such a body, yttrium for instance, and if we add to it an excess of strong ammonia, we obtain a precipitate which appears perfectly homogeneous. But if instead we add very dilute ammonia in quantity sufficient only to precipitate one half of the base present, we obtain no immediate precipitate. If we stir up the whole thoroughly so as to ensure a uniform mixture of the solution and the ammonia, and set the vessel aside for an hour, carefully excluding dust, we may still find the liquid clear and bright without any vestige of turbidity. After three or four hours, however, an opalescence will declare itself, and the next morning a precipitate will have appeared.” — pp. 207-8 (*Chemical News*, May 25, 1888)

“Now let us ask ourselves, What can be the meaning . . .”

p/q: William Crookes, “Elements and Meta-Elements,” March 28, 1888: “Now, let us ask ourselves what can be the meaning of this phenomenon? The quantity of precipitant added was insufficient to throw down more than half the yttria present, therefore a process akin to selection has been going on for several hours. The precipitation has evidently not been effected at random, those molecules of the base being decomposed which happened to come in contact with a corresponding molecule of ammonia, for we have taken care that the liquids should be uniformly mixed, so that one molecule of the original salt would not be more exposed to decomposition than any other.” — p. 208 (*Chemical News*, May 25, 1888)

“If, further, we consider the time which elapses . . .”

p/q: William Crookes, “Elements and Meta-Elements,” March 28, 1888: “If, further, we consider the time which elapses before the appearance of a precipitate, we cannot avoid coming to the conclusion that the action which has been going on for the first few hours is of a *selective* character. The problem is not *why* a precipitate is produced, but *what determines* or directs some atoms to fall down and others to remain in solution. Out of the multitude of atoms present, what power is it that directs each atom to choose the proper path? We may picture to ourselves some directive force passing the atoms one by one in review, selecting one for precipitation and another for solution, till all have been adjusted.” — p. 208 (*Chemical News*, May 25, 1888)

“In the Birmingham address already referred to . . .”

p/q: William Crookes, “*Elements and Meta-Elements*,” March 28, 1888: “In the Birmingham address already referred to, I asked my audience to picture the action of two forces on the original protyle, one being *time*, accompanied by a lowering of temperature; the other, swinging to and fro like a mighty pendulum, having periodic cycles of ebb and swell, rest and activity, being intimately connected with the imponderable matter, essence, or source of energy we call *electricity*. Now, a simile like this effects its object if it fixes in the mind the particular fact it is intended to emphasize, but it must not be expected necessarily to run parallel with all the facts. Besides the ebb and flow of temperature with the periodic ebb and flow of electricity, positive or negative, requisite to confer on the newly born elements their particular atomicity, it is evident that a third factor must be taken into account. Nature does not act on a flat plane; she demands space for her cosmogenic operations, and if we introduce *space* as the third factor all appears clear.” — p. 227 (*Chemical News*, June 8, 1888)

“Instead of a pendulum . . .”

p/q: William Crookes, “*Elements and Meta-Elements*,” March 28, 1888: “Instead of a pendulum, which though to a certain extent a good illustration is impossible as a fact, let us seek some more satisfactory way of representing what I conceive may have taken place. Let us suppose the zigzag diagram not drawn upon a plane, but projected in space of three dimensions. What figure can we best select to meet all the conditions involved?” — p. 227 (*Chemical News*, June 8, 1888)

“Many of the facts can be well explained . . .”

p/q: William Crookes, “*Elements and Meta-Elements*,” March 28, 1888: “Many of the facts can be well explained by supposing the projection in space of Professor Emerson Reynolds’s zigzag curve to be a spiral. This figure is, however, inadmissible, inasmuch as the curve has to pass through a point neutral as to electricity and chemical energy twice in each cycle. We must therefore adopt some other figure. A figure of eight or lemniscate will foreshorten into a zigzag just as well as a spiral, and it fulfils every condition of the problem.” — p. 227 (*Chemical News*, June 8, 1888)

“Such a figure will result . . .”

p/q: William Crookes, “*Elements and Meta-Elements*,” March 28, 1888: “Such a figure will result from three very simple simultaneous motions. First, a simple oscillation backwards and forwards (suppose east and west); secondly, a simple oscillation at right angles to the former (suppose north and south) of half the periodic time, *i.e.*, twice as fast; and thirdly, a motion at right angles to these two (suppose downwards), which, in its simplest form, would be with unvarying velocity.” — p. 227 (*Chemical News*, June 8, 1888)

“If we project this figure in space . . .”

p/q: William Crookes, "Elements and Meta-Elements," March 28, 1888: "If we project this figure in space we find on examination that the points of the curves where chlorine, bromine, and iodine are formed come close under each other; so also will sulphur, selenium, and tellurium; again, phosphorus, arsenic, and antimony, and in like manner other series of analogous bodies." — p. 227 (*Chemical News*, June 8, 1888)

"It may be asked whether this scheme explains . . ."

p/q: William Crookes, "Elements and Meta-Elements," March 28, 1888: "It may be asked whether this scheme explains *how* and *why* the elements appear in this order? Let us imagine a cyclical translation in space, each evolution witnessing the genesis of the group of elements which I previously represented as produced during one complete vibration of the pendulum. Let us suppose that one cycle has thus been completed, the centre of the unknown creative force in its mighty journey through space having scattered along its track the primitive atoms, the seeds, if I may use the expression, which presently are to coalesce and develop into the groupings now known as lithium, beryllium, boron, carbon, nitrogen, oxygen, fluorine, sodium, magnesium, aluminium, silicon, phosphorus, sulphur, and chlorine." — p. 227 (*Chemical News*, June 8, 1888)

"What is most probably the form . . ."

p/q: William Crookes, "Elements and Meta-Elements," March 28, 1888: "What is most probably the form of track now pursued? Were it strictly confined to the same plane of temperature and time, the next elementary groupings to appear would again have been those of lithium, and the original cycle would have been eternally repeated, producing again and again the same fourteen elements. The conditions, however, are not quite the same. Space and electricity are as at first; but temperature has altered, and thus, instead of the atoms of lithium being supplemented with atoms in all respects analogous with themselves, the atomic groupings which come into being when the second cycle commences form not lithium but its lineal descendant, potassium." — pp. 227-8 (*Chemical News*, June 8, 1888)

"Suppose, therefore, the *vis generatrix* . . ."

p/q: William Crookes, "Elements and Meta-Elements," March 28, 1888: "Suppose, therefore, the *vis generatrix* [*generative force*] travelling to and fro in cycles along a lemniscate path as above suggested, while simultaneously temperature is declining and time is flowing on (variations which I have endeavoured to represent by the downward sink) each coil of the lemniscate track crosses the same vertical line at lower and lower points. Projected in space, the curve shows a central line neutral as far as electricity is concerned, and neutral in chemical properties — positive electricity on the north, negative on the south. Dominant atomicities are governed by the distance east and west from the neutral centre line, monatomic elements being one remove from it, diatomic two removes, and so on. In every successive coil the same law holds good." — p. 228 (*Chemical News*, June 8, 1888)

"We have now traced the formation . . ."

p/q: William Crookes, "Elements and Meta-Elements," March 28, 1888: "We have now traced the formation of the chemical elements from knots and voids in a primitive, formless fluid. We have shown the possibility, nay, the probability, that the atoms are not eternal in existence, but share with all other created beings the attributes of decay and death." — p. 228 (*Chemical News*, June 8, 1888)

"We have shown, from arguments . . ."

p/q: William Crookes, "Elements and Meta-Elements," March 28, 1888: "We have shown, from arguments drawn from the chemical laboratory, that in matter which has responded to every test of an element, there are minute shades of difference which may admit of selection. We have seen that the

time-honoured distinction between elements and compounds no longer keeps pace with the developments of chemical science, but must be modified to include a vast array of intermediate bodies — ‘meta-elements.’ We have shown how the objections of Clerk-Maxwell, weighty as they are, may be met; and finally, we have adduced reasons for believing that primitive matter was formed by the act of a generative force, throwing off at intervals of time atoms endowed with varying quantities of primitive forms of energy.” — p. 228 (*Chemical News*, June 8, 1888)

“If we may hazard any conjectures . . .”

p/q: William Crookes, “Elements and Meta-Elements,” March 28, 1888: “If we may hazard any conjectures as to the source of energy embodied in a chemical atom, we may, I think, premise that the heat radiations propagated outwards through the ether from the ponderable matter of the universe, by some process of nature not yet known to us, are transformed at the confines of the universe into the primary — the essential — motions of chemical atoms, which, the instant they are formed, gravitate inwards, and thus restore to the universe the energy which otherwise would be lost to it through radiant heat. If this conjecture be well founded, Sir William Thomson’s startling prediction of the final decrepitude of the universe through the dissipation of its energy falls to the ground.” — p. 228 (*Chemical News*, June 8, 1888)

If it had, the difficulties of perpetual-motion seekers would have ended, and this problem would have become an established and operating fact. It would only require an introductory impulse of a few pounds, on such a device, to cause it to run for centuries. In the conception of my vibratory engine, I did not seek to attain perpetual motion; but a circuit is formed that actually has a neutral centre, which is in a condition to be vivified by my vibratory ether, and while under operation, by said substance, is really a machine that is virtually independent of the mass (or globe), and it is the wonderful velocity of the vibratory circuit which makes it so. Still, with all its perfection, it requires to be fed with the vibratory ether to make it an independent motor . . .’ ” — p. 201

To look down into the depths of an etheric centre is precisely the same as it would be to search into the broad space of heaven’s ether to find the end; with this difference, that one is the positive field, while the other is the negative field . . .’ ” — p. 201

I can only answer this question properly by entering into a progressive synthesis, starting on the rotating etheric centres that were fixed by the Creator with their attractive or accumulative power. If you ask what power it is that gives to each etheric atom its inconceivable velocity of rotation, or introductory impulse, I must answer that no finite mind will ever be able to conceive what it is. The philosophy of accumulation . . . is the only proof that such a power has been given.’ ” — pp. 199-200

“The area, if we can so speak, of such an atom . . .”

p/q: Mrs. Bloomfield Moore, *Keely and His Discoveries*, 1893: “ ‘The area, if we can so speak of such an atom, presents to the attractive or magnetic, the elective or propulsive, all the receptive force and all the antagonistic force that characterizes a planet of the largest magnitude; consequently, as the accumulation goes on, the perfect equation remains the same. When this minute centre has once been fixed, the power to rend it from its position would necessarily have to be so great as to displace the most immense planet that exists. When this atomic neutral centre is displaced, the planet must go with it. The neutral centre carries the full load of any accumulation from the start, and remains the same, for ever balanced in the eternal space.’ ” — p. 200

“We will imagine that . . .”

p/q: Mrs. Bloomfield Moore, *Keely and His Discoveries*, 1893: “ ‘We will imagine that, after an accumulation of a planet of any diameter — say, 20,000 miles more or less, for the size has nothing to do with the problem — there should be a displacement of all the material, with the exception of a crust 5,000 miles thick, leaving an intervening void between this crust and a centre of the size of an ordinary billiard ball, it would then require a force as great to move this small central mass as it would to move the shell of 5000 miles thickness. Moreover, this small central mass would carry the load of this crust for ever, keeping it equi-distant; and there could be no opposing power, however great, that could bring them together. The imagination staggers in contemplating the immense load which bears upon this point of centre, where weight ceases. This is what we understand by a neutral centre.’ ” — p. 200

“The coal mines of the world cannot long afford . . .”

p/q: Mrs. Bloomfield Moore, *Keely's Secrets*, July 10, 1888: “The coal mines of the world cannot long afford the increasing drain made upon them. Steam has reached its utmost limits of power, and does not fulfil the requirements of the age. It knows that its days are numbered. Electricity holds back, with bated breath, dependent upon the approach of her sister colleague. Air ships are riding at anchor, as it were, waiting for the force which is to make aerial navigation something more than a dream. As easily as men communicate with their offices from their homes by means of the telephone, so will the inhabitants of separate continents talk across the ocean. Imagination is palsied when seeking to foresee the grand results of this marvellous discovery when once it is applied to art and mechanics. In taking the throne which it will force steam to abdicate dynaspheric force will rule the world with a power so mighty in the interests of civilization, that no finite mind can conjecture the results.” — pp. 16-17 (T. “It is as platina to hydrogen gas. . . .”

p/q: Mrs. Bloomfield Moore, *Keely and His Discoveries*, 1893: “It is as platina to hydrogen gas. Molecular separation of air brings us to the first subdivision only; inter-molecular, to the second; atomic, to the third; inter-atomic, to the fourth; etheric, to the fifth; and inter-etheric, to the sixth sub-division, or positive association with luminiferous ether. In my introductory argument I have contended that this is the vibratory envelope of all atoms. In my definition of atom I do not confine myself to the sixth subdivision, where this luminiferous ether is developed in its crude form, as far as my researches prove. I think this idea will be pronounced, by the physicists of the present day, a wild freak of the imagination. Possibly, in time, a light may fall upon this theory that will bring its simplicity forward for scientific research. At present I can only compare it to some planet in a dark space, where the light of the sun of science has not yet reached it.” — p. 202

“I assume that sound, like odour, is a real substance . . .”

p/q: Mrs. Bloomfield Moore, *Keely and His Discoveries*, 1893: “I assume that sound, like odour, is a real substance of unknown and wonderful tenuity, emanating from a body where it has been induced by percussion and throwing out absolute corpuscles of matter — inter-atomic particles — with a velocity of 1120 feet per second, in vacuo 20,000. The substance which is thus disseminated is a part and parcel of the mass agitated, and if kept under this agitation continuously would, in the course of a certain cycle of time, become thoroughly absorbed by the atmosphere; or, more truly, would pass through the atmosphere to an elevated point of tenuity corresponding to the condition of subdivision that governs its liberation from its parent body.” — pp. 202-3

“The sounds from vibratory forks . . .”

p/q: Mrs. Bloomfield Moore, *Keely and His Discoveries*, 1893: “The sounds from vibratory forks, set so as to produce etheric chords, while disseminating their compound tones permeate most thoroughly all substances that come under the range of their atomic bombardment. The clapping of a bell in vacuo liberates these atoms with the same velocity and volume as one in the open air . . .” — p. 203

“ . . . and were the agitation of the bell kept up continuously . . . ”

p/q: Mrs. Bloomfield Moore, *Keely and His Discoveries*, 1893: “. . . and were the agitation of the bell kept up continuously for a few millions of centuries, it would thoroughly return to its primitive element. If the chamber were hermetically sealed, and strong enough, the vacuous volume surrounding the bell would be brought to a pressure of many thousands of pounds to the square inch, by the tenuous substance evolved.” — p. 203

“In my estimation, sound truly defined is the disturbance of atomic equilibrium . . . ”

p/q: Mrs. Bloomfield Moore, *Keely and His Discoveries*, 1893: “In my estimation, *sound truly defined is the disturbance of atomic equilibrium, rupturing actual atomic corpuscles; and the substance thus liberated must certainly be a certain order of etheric flow.* Under these conditions is it unreasonable to suppose that, if this flow were kept up, and the body thus robbed of its element, it would in time disappear entirely? All bodies are formed primitively from this highly tenuous ether, animal, vegetable and mineral, and they only return to their high gaseous condition when brought under a state of differential equilibrium.” — p. 203

“As regards odour, we can only get some definite idea . . . ”

p/q: Mrs. Bloomfield Moore, *Keely and His Discoveries*, 1893: “As regards odour . . . we can only get some definite idea of its extreme and wondrous tenuity by taking into consideration that a large area of atmosphere can be impregnated for a long series of years from a single grain of musk; which, if weighed after that long interval, will be found to be not appreciably diminished. The great paradox attending the flow of odorous particles is that they can be held under confinement in a glass vessel! Here is a substance of much higher tenuity than the glass that holds it, and yet it cannot escape. It is as a sieve with its meshes large enough to pass marbles, and yet holding fine sand which cannot pass through; in fact, a molecular vessel holding an atomic substance. This is a problem that would confound those who stop to recognize it.” — pp. 203-4

“But infinitely tenuous as odour is . . . ”

p/q: Mrs. Bloomfield Moore, *Keely and His Discoveries*, 1893: “But infinitely tenuous as odour is, it holds a very crude relation to the substance of subdivision that governs a magnetic flow (a flow of sympathy, if you please to call it so). This subdivision comes next to sound, but is above sound. The action of the flow of a magnet coincides somewhat to the receiving and distributing portion of the human brain, giving off at all times a depreciating ratio of the amount received. It is a grand illustration of the control of mind over matter, which gradually depreciates the physical till dissolution takes place. The magnet on the same ratio gradually loses its power and becomes inert. If the relations that exist between mind and matter could be equated, and so held, we would live on in our physical state eternally, as there would be no physical depreciation. But this physical depreciation leads, at its terminus, to the source of a much higher development — viz., the liberation of the pure ether from the crude molecular; which in my estimation is to be much desired.” — p. 204

‘soul,’ the latter had to pass through the seven planetary chambers before it made its exit through the symbolical apex. Each chamber typified, at the same time, one of the seven spheres, and one of the seven higher types of physico-spiritual humanity alleged to be above our own. Every 3,000 years, the soul, representative of its race, had to return to its primal point of departure before it underwent another evolution into a more perfected spiritual and physical transformation.” — 1:296-7

With hydrogen of atomic weight = 1, there is little room for other elements, save perhaps for hypothetical helium. But what if we get ‘through the looking-glass,’ and cross the zero-line in search of new principles, — what shall we find on the other side of zero? Dr. Carnelley asks for an element of negative atomic weight; here is ample room and verge enough for a shadow series of such unsubstantialities. Helmholtz says that electricity is probably as atomic as matter: is electricity one of the negative elements? and the luminiferous ether another? Matter, as we now know it, does not here exist; the forms of energy which are apparent in the motions of matter are as yet only latent possibilities. a star. Before the birth of atoms to gravitate towards one another, no pressure could be exercised; but at the outskirts of the fire-mist sphere, within which all is protyle, — at the shell on which the tremendous forces involved in the birth of a chemical element exert full sway, — the fierce heat would be accompanied by gravitation sufficient to keep the newly born elements from flying off into space. As temperature increases expansion and molecular motion increase, molecules tend to fly asunder, and their chemical affinities become deadened; but the enormous pressure of the gravitation of the mass of atomic matter outside what I may for brevity call the birth-shell would counteract this action of heat.” — p. 125 (*Chemical News*, Sept. 3, 1886)

Of the attempts hitherto made to define or explain an element none satisfy the demands of the human intellect. The text-books tell us that an element is ‘a body which has not been decomposed;’ that it is ‘a something to which we can add, but from which we can take away nothing,’ or ‘a body which increases in weight with every chemical change.’ Such definitions are doubly unsatisfactory: they are provisional, and may cease tomorrow to be applicable in any given case. p/q: William Crookes, “Address to the Chemical Section of the British Association,” Sept. 2, 1886: “We have glanced at the difficulty of defining an element; we have noticed too the revolt of many leading physicists and chemists against the ordinary acceptation of the term element. We have weighed the improbability of their eternal self-existence, or their origination by chance. As a remaining alternative we have suggested their origin by a process of evolution like that of the heavenly bodies according to Laplace, and the plants and animals of our globe according to Lamarck, Darwin, and Wallace. In the general array of the elements, as known to us, we have seen a striking approximation to that of the organic world. In lack of direct evidence of the decomposition of any element, we have sought and found indirect evidence. . . . p/q: William Crookes, “Address to the Chemical Section of the British Association,” Sept. 2, 1886: “Professor Emerson Reynolds . . . points out that in each period the general properties of the elements vary from one to another with approximate regularity until we reach the seventh member, which is in more or less striking contrast with the first element of the same period, as well as with the first of the next. Thus chlorine, the seventh member of Mendeleeff’s third period, contrasts sharply both with sodium, the first member of the same series, and with potassium, the first member of the next series, whilst, on the other hand, sodium and potassium are closely analogous. The six elements whose atomic weights intervene between sodium and potassium vary in properties, step by step, until chlorine, the contrast to sodium, is reached. But from chlorine to potassium, the analogue of sodium, there is a change in properties *per saltum*.” — pp. 119-20 (*Chemical News*, Sept. 3, 1886)

In general the *fourth* element of each series possesses the properties we might expect a transition-element to exhibit. . . . Thus for the purpose of graphic translation Professor Reynolds considers that the fourth member of a period — silicon, for example — may be placed at the apex of a symmetrical curve, which shall represent, for that particular period, the direction in which the properties

“Almost always each ring of vapours must have been broken up . . .”

p/q: Alexander Winchell, *World-Life, or Comparative Geology*, 1883: “Almost always each ring of vapors must have broken up into numerous masses, which, moving with a nearly uniform velocity, must have continued to circulate at the same distance around the sun. These masses must have taken a spheroidal form, with a motion of rotation in the same direction as their revolution, since the inner molecules (those nearest the sun) would have less actual velocity than the exterior ones. They must then have formed as many planets in a state of vapor. But if one of them was sufficiently powerful to unite successively, by its attraction, all the others around its centre, the ring of vapors must have been thus transformed into a single spheroidal mass of vapors circulating around the sun with a rotation in the same direction as its revolution. The latter case has been the more common, but the solar system presents us the first case in the four small planets which move between Jupiter and Mars.” — p. 614

p/q: “Do the Adepts Deny the Nebular Theory?” 1885: “. . . they find that the centrifugal theory of Western birth is unable to cover *all* the ground. That, unaided, it *can* neither account for every spheroid oblate, nor explain away such evident difficulties as are presented by the relative density of some planets. How indeed can any calculation of centrifugal force explain to us, for instance, why Mercury, whose rotation is, we are told, only ‘about one-third that of the Earth, and its density only about one-fourth greater than the Earth,’ should have a polar compression *more than ten times greater than the latter?* And again, why Jupiter, whose equatorial rotation is said to be ‘twenty-seven times greater, and its density only about one-fifth that of the Earth,’ should have its polar compression seventeen times greater than that of the Earth? Or, why Saturn, with an equatorial velocity fifty-five times greater than Mercury for centrifugal force to contend with, should have its polar compression *only three times greater than Mercury’s?*” — pp. 249-50 (*Five Years of Theosophy*)

“To crown the above contradictions . . .”

p/q: “Do the Adepts Deny the Nebular Theory?” 1885: “To crown the above contradictions, we are asked to believe in the Central Forces as taught by modern science, even when told that the equatorial matter of the sun, with more than four times the centrifugal velocity of the earth’s equatorial surface and only about one-fourth part of the gravitation of the equatorial matter, has not manifested any tendency to bulge out at the solar equator, nor shown the least flattening at the poles of the solar axis. In other and clearer words, the sun, with only one-fourth of our earth’s density for the centrifugal force to work upon, has no polar compression at all! We find this objection made by more than one astronomer, yet never explained away satisfactorily so far as the ‘Adepts’ are aware.” — p. 250 (*Five Years of Theosophy*)

Huggins. Toute nébuleuse dont le spectre ne contient que des lignes brillantes est gazeuse et, par suite, dit-on, irrésoluble; toute nébuleuse dont le spectre est continu doit finir par se résoudre en étoiles avec un instrument suffisamment puissant. Cet énoncé est contraire à la fois aux résultats de l’observation et à la théorie spectroscopique [The question of the resolvability of the nebulae has been often presented in a too affirmative manner and quite contrary to the ideas expressed by the illustrious observer of the spectra of these stars — Huggins. Every nebula of which the spectrum contains only bright lines is gaseous, and hence, it is said, irresolvable; every nebula of which the spectrum is continuous, must finally – with a sufficiently powerful instrument – resolve into stars. “The Lyra nebula, the Dumb-bell nebula, the central region of the nebula of Orion . . .”

p/q: C. Wolf, *Les Hypothèses Cosmogoniques*, 1886: “La nébuleuse de la Lyre, la *Dumbbell nebula*, la région centrale de la nébuleuse d’Orion, paraissent résolubles, et donnent un spectre de lignes brillantes; la nébuleuse des Chiens de chasse n’est pas résoluble et donne un spectre continu. C’est qu’en effet le spectroscopie nous renseigne sur l’état physique de la matière constitutive des astres, mais non sur son mode d’agrégation. Une nébuleuse formée de globes gazeux (ou même de noyaux peu lumineux entourés d’une puissante atmosphère) donnerait un spectre de lignes et serait cependant

résoluble; tel parait être l'état de la région d'Huygens dans la nébuleuse d'Orion. Une nébuleuse formée de particules solides ou liquides incandescentes, un véritable nuage, donnera un spectre continu et sera irrésoluble [The Lyra nebula, the *Dumb-bell nebula*, and the central region of the nebula of Orion, appear resolvable, and show a spectrum of bright lines; the nebula of Canis Venatici is not resolvable, and gives a continuous spectrum. It is indeed the spectroscopist that informs us about the physical state of the constituent matter of the stars, but affords us nothing about its mode of aggregation. A nebula formed of gaseous globes (or even of nuclei, faintly luminous, surrounded by a powerful atmosphere) would give a spectrum of lines and be still resolvable; such seems to be the state of Huygens region in the Orion nebula. A nebula formed of solid particles or incandescent fluids, a true cloud, will give a continuous spectrum and will be irresolvable].” — p. 4 fn.

Si le chaos originel était un gaz froid, on comprendra comment la contraction résultant de l'attraction a pu l'échauffer et le rendre lumineux; il faudra expliquer la condensation de ce gaz à l'état de particules incandescentes dont le spectroscopie nous révèle l'existence dans certaines nébuleuses. Si le chaos était formé de telles particules, comment certaines portions ont-elles passé à l'état gazeux, tandis que d'autres conservaient leur état primitif [But when we want to go further and return to the primitive chaos which produced the totality of the heavenly bodies, we have to account for the actual existence of these two classes of nebulae. If the original chaos was a cold gas, one would understand how the contraction resulting from attraction could have heated it and made it luminous. We would have to explain the condensation of this gas to the state of incandescent particles, the existence of which in certain nebulae is revealed to us by the spectroscopie. A superfice was compared to the number three, because it is the first of all causes that are found in figures; for a circle, which is the principal of all round figures, comprises a triad, in centre — space — circumference. But a triangle, which is the first of all rectilinear figures, is included in a ternary, and receives its form according to that number; and was considered by the Pythagoreans to be the author of all sublunary things. You may gather some idea as to the way in which the various elements start into existence from these three principles into which *Mulaprakriti* is differentiated, by examining the lecture delivered by Professor Crookes a short time ago upon the so-called elements of modern chemistry. This lecture will at least give you some idea of the way in which the so-called elements spring from *Vishwanara*, the most objective of these three principles, which seems to stand in the place of the *protyle* mentioned in that lecture. Except in a few particulars, this lecture seems to give the outlines of the theory of physical evolution on the plane of *Vishwanara* and is, as far as I know, the nearest approach made by modern investigators to the real occult theory on the subject.” — p. 308 (*The Theosophist*, v. 8)

Hitherto the molecule has been regarded as an aggregate of two or more atoms, and no account has been taken of the architectural design on which these atoms have been joined. We may consider that the structure of a chemical element is more complicated than has hitherto been supposed. But Leibniz was not a scientific man in the modern sense of the word. Had he been so, he might have worked out the conception of energy, defined mathematically the ideas of force and mechanical work, and arrived at the conclusion that, even for purely scientific purposes, it is desirable to look upon force, not as a primary quantity, but as a quantity derived from some other value.” — p. 141

“Leibniz was a philosopher . . .”

p/q: John Theodore Merz, *Leibniz*, 1884: “Leibniz was a philosopher, and as such he had certain primary principles, which biassed him in favour of certain conclusions, and his discovery that external things were substances endowed with force was at once used for the purpose of applying these principles. One of these principles was the law of continuity, the conviction that everything in the world was connected, that there were no gaps and chasms which could not be bridged over. The contrast of extended and thinking substances was unbearable to him. The definition of the extended substances had already been found untenable: it was natural that a similar inquiry was made into the definition of mind, the thinking substance.” — pp. 141-2

With him there existed ever an infinite gradation of thought. . . .

p/q: John Theodore Merz, *Leibniz*, 1884: “Leibniz . . . could not agree with [Descartes] in limiting the thinking process merely to clear and distinct thoughts. On the contrary, there existed an infinite gradation of thoughts. this . . . “at once widened the realm of mental life . . .”

p/q: John Theodore Merz, *Leibniz*, 1884: “If this conception of mind . . . at once widened the realm

of mental life, destroying the contrast of animate and inanimate nature, it did yet more: it reacted on the conception of matter, of the extended substance. For it became evident that external or material things presented this property of extension only to our senses, not to our thinking faculties. The mathematician, in order to calculate geometrical figures, had been obliged to divide them into an infinite number of infinitely small parts, and the physicist saw no limit to the divisibility of matter into atoms. The bulk, through which external things seemed to fill space, was a property which they acquired only through the coarseness of our senses.” — pp. 142-3

“Leibnitz followed these arguments to some extent . . .”

p/q: John Theodore Merz, *Leibniz*, 1884: “Leibniz followed the arguments of Gassendi to some extent, but he could not rest content in assuming that matter was composed of a finite number of very small (though not infinitely small) parts. His mathematical mind forced him to carry out the argument *in infinitum*. And what became of the atoms then? They lost their extension, and they retained only the property of resistance — they were the centres of force. They were reduced to mathematical points . . .” — pp. 143-4

“but if their extension in space was nothing . . .”

p/q: John Theodore Merz, *Leibniz*, 1884: “. . . but if their extension in space was nothing, so much fuller was their inner life. Assuming that inner existence, such as that of the human mind, is a new dimension — not a geometrical but a metaphysical dimension — we might say that Leibniz, after having reduced the geometrical extension of the atoms to nothing, endowed them with an infinite extension in the direction of their metaphysical dimension. After having lost sight of them in the world of space, the mind has, as it were, to dive into a metaphysical world to find and grasp the real essence of what appears in space merely as a mathematical point. As a cone standing on its point, or a perpendicular straight line, cuts a horizontal plane only in one mathematical point, but may extend indefinitely in height and depth, so the essences of things real have only a punctual existence in this physical world of space, but have an infinite depth of inner life in the metaphysical world of thought.” — p. 144

Finally, and this is a point where these monads of Leibniz closely resemble the Elementals of mystic philosophy, these monads are representative beings. Every monad reflects every other. Every monad is a living mirror of the universe, within its own sphere. And mark this, for upon it depends the power possessed by these monads, and upon it depends the work they can do for us: in mirroring the world, the monads are not mere passive reflective agents, but *spontaneously self-active*; they produce the images spontaneously, as the soul does a dream. In every monad, therefore, the adept may read everything, even the future. Every monad — or elemental — is a looking-glass that can speak.” — p. 297 (*The Path*, v. 1)

Events germinate and unfold. They have a past which is connected with their present, and we feel a well justified confidence that a future is appointed which will be similarly connected with the present and the past. This continuity and unity of history repeat themselves before our eyes in all conceivable stages of progress. The phenomena furnish us the grounds for the generalization of two laws which are truly *principles of scientific divination*, by which alone the human mind penetrates the sealed records of the past and the unopened pages of the future. “The astronomers who preceded the epoch 1,491 . . .”

p/q: J. S. Bailly, *Traité de l'Astronomie Indienne et Orientale*, 1787: “Les Astronomes qui ont précédé l'époque de 1491, sont d'abord les Grecs d'Alexandrie; Hypparque a fleuri 125 ans avant notre ère, & Ptolémée 260 ans après Hypparque. Ce sont ensuite les Arabes qui ont cultivé de nouveau l'Astronomie dans le IX siècle. Les Persans & les Tartares ont succédé, & nous leur devons les Tables de Nassireddin en 1269, & celles d'Ulug-beg en 1437. Voilà quelle a été la succession connue des choses en Asie avant l'époque indienne de 1491. Or, cela posé, qu'est-ce qu'une époque? C'est l'observation de la longitude d'un astre pour un tems déterminé, le lieu du ciel où il a été vu, & qui sert de point fixe, de point de départ pour calculer, au moyen du mouvement observé, son lieu dans le ciel, tant pour le passé que pour l'avenir. Une époque n'est d'aucun usàge quand le mouvement n'a pas été déterminé [(ad. *SD*) The astronomers who preceded the epoch of 1,491 are, first, the Greeks of Alexandria; Hipparchus, who flourished 125 years before our era, and Ptolemy, 260 years after Hipparchus. Following these were the Arabs, who revived astronomy in the ninth century. These were succeeded by the Persians and the Tartars, to whom we owe the tables of Nasireddin in 1269, and those of Ulug-beg in 1437. Such has been the succession of events in Asia as known prior to the Indian epoch of 1491. What, then, is an epoch? It is the observation of the longitude of a star at a given time, the place in the sky where it was seen, and which serves as a point of reference, a starting-point from which to calculate both the past and future positions of the star from its observed motion. But an epoch is useless unless the motion of the star has been determined].” — p. xx

“A people, new to science and obliged to borrow a foreign astronomy . . .”

p/q: J. S. Bailly, *Traité de l'Astronomie Indienne et Orientale*, 1787: “Un peuple nouveau dans la science, un peuple obligé d'emprunter une Astronomie étrangère, n'est pas embarrassé d'établir une époque, il lui suffit d'une observation qu'il peut faire à chaque instant. Ce qui lui est nécessaire, ce qu'il a besoin d'emprunter, ce sont les élémens qui dépendent d'une détermination délicate, & qui exigent des recherches suivies; ce sont sur-tout les mouvemens qui dépendent du tems, & qu'on ne connoît avec précision que par des siècles d'observation. Il faut donc qu'il demande, avant tout, ces mouvemens aux peuples qui ont fait les observations, & qui ont derrière eux des siècles de travaux. Concluons qu'un peuple nouveau n'empruntera pas les époques d'un peuple ancien, sans emprunter ses moyens

mouvemens. En partant de ce principe, on ne trouve point que les époques indiennes de 1491 & de l’an 3102 aient pu être déduites des époques ni de Ptolémée ni d’Ulug-beg [A people, new to science and obliged to borrow a foreign astronomy, finds no difficulty in fixing an epoch, since the only observation needed is one which can be made at any moment. But what it needs above all, what it is required to borrow, are the elements which depend on accurate determination, and which require continuous observation; above all, those motions that depend on time, and which can only be accurately determined by centuries of observation. These motions, then, must be borrowed from a nation that has made such observations, and has behind it the labors of centuries. Let us conclude, therefore, that a new people will not borrow the epochs of an ancient one, without also borrowing from them the ‘average motions.’ Starting from this principle we find that the Hindu epochs 1491 and 3102 could not have been derived from those of either Ptolemy or Ulug-beg].” — pp. xx-xxi

— 659 —

There remains the supposition that the Hindus, comparing their observations . . .

p/q: J. S. Bailly, *Traité de l’Astronomie Indienne et Orientale*, 1787: “Il reste à supposer que les Indiens, comparant leurs observations en 1491 aux observations faites antérieurement par Ulug-beg & par Ptolémée, se soient servis des intervalles de ces observations pour déterminer les moyens mouvemens. Les tems d’Ulug-beg étoient trop proches pour une pareille détermination; ceux de Ptolémée & d’Hypparque étoient à peine à une distance suffisante. Mais si les mouvemens indiens avoient été déterminés par ces comparaisons, les époques seroient enchainées. En partant des époques d’Ulug-beg & de Ptolémée, on retrouverait toutes les époques des Indiens. Les époques étrangères ont donc été inconnues ou inutiles aux Indiens [There remains the supposition that the Hindus, comparing their observations in 1491 with those previously made by Ulug-beg and Ptolemy, made use of the periods between these observations to determine the ‘average motions.’ The dates of Ulug-beg were too recent for such a determination; while those of Ptolemy and Hipparchus were barely remote enough. But if the Hindu motions had been determined from these comparisons, the epochs would be connected together. Starting from the epochs of Ulug-beg and Ptolemy we should arrive at all those of the Hindus. Hence foreign epochs were either unknown or useless to the Hindus].” — pp. xxi-xxii

We may add to this another important consideration. . . .

p/q: J. S. Bailly, *Traité de l’Astronomie Indienne et Orientale*, 1787: “Nous ajouterons encore une considération importante; c’est que lorsqu’un peuple est obligé de prendre chez ses voisins les méthodes ou les moyens mouvemens de ses Tables astronomiques, il a bien plus besoin de leur emprunter & la connoissance des inégalités du mouvement, & le mouvement de l’apogée, des nœuds, & l’obliquité de l’écliptique; enfin tous les élémens dont la détermination exacte suppose l’art d’observer, un appareil quelconque d’instrumens & beaucoup d’industrie. Tous ces élémens de la science, plus ou moins différens chez les Grecs d’Alexandrie, les Arabes, les Perses, les Tartares n’ont aucune ressemblance avec ceux des indiens. Les Indiens n’ont donc rien emprunté de leurs voisins [We may add to this another important consideration. When a nation is obliged to borrow from its neighbours the methods or the average motions of its astronomical tables, it has even greater need to borrow, besides these, the knowledge of the inequalities of the motions of the heavenly bodies, the motions of the apogee, of the nodes, and of the inclination of the ecliptic; in short, all those elements the exact determination of which requires the art of observing, some instrumental appliances, and great industry. All these elements of this science, differing more or less with the Greeks of Alexandria, the Arabs, the Persians and the Tartars, exhibit no resemblance whatever with those of the Hindus. The Hindus, therefore, borrowed nothing from their neighbours].” — p. xxii

If the Hindus did not borrow their epoch, they must have possessed a real one of their own . . .

p/q: J. S. Bailly, *Traité de l'Astronomie Indienne et Orientale*, 1787: "Si les Indiens n'ont point emprunté leur époque, il faut qu'ils en aient une réelle, fondée sur leurs propres observations; ce ne peut être que l'époque de l'an 1491, ou celle de l'an 3102 avant notre ère, & qui précède de 4592 ans l'époque de 1491. Il s'agit de choisir entre ces deux époques, & de décider laquelle est fondée sur une observation [If the Hindus did not borrow their epoch, they must have possessed a real one of their own, based on their own observations; and this can only be either the epoch of the year 1491, or that of the year 3102 before our era, and the latter preceding by 4592 years the epoch of 1491. We have to choose between these two epochs and decide which of them is based on observation]." — p. xxii

— 659-60 —

But before stating the arguments which can and must decide the question . . .

p/q: J. S. Bailly, *Traité de l'Astronomie Indienne et Orientale*, 1787: "Mais avant d'exposer les raisons qui peuvent & doivent résoudre le problème, qu'il nous soit permis de proposer quelques réflexions à ceux qui seroient tentés de croire que ce sont des observations & des calculs modernes qui ont fait établir aux Indiens l'état passé du ciel. Ce n'est pas une chose aisée que de connoître les mouvemens célestes avec assez de précision pour remonter dans les tems à une distance de 4592 ans, & pour décrire les phénomènes qui ont dû arriver à cette époque [But before stating the arguments which can and must resolve the problem, we may be permitted to make a few remarks to those who may be inclined to believe that these are modern observations and calculations which have enabled the Hindus to determine the past positions of the heavenly bodies. It is far from easy to determine the celestial movements with sufficient accuracy to ascend the stream of time for 4592 years, and to describe the phenomena which must have occurred at that period]." — pp. xxii-xxiii

— 660 —

We possess to-day excellent instruments; exact observations have been made . . .

p/q: J. S. Bailly, *Traité de l'Astronomie Indienne et Orientale*, 1787: "Nous avons aujourd'hui d'excellens instrumens, nous faisons depuis deux ou trois siècles des observations exactes, qui suffisent déjà pour nous faire connoître assez bien les moyens mouvemens des planètes; nous avons les observations des Chaldéens, d'Hypparque & de Ptolémée, qui par leur éloignement des tems où nous sommes . . . permettent de déterminer ces mouvemens avec plus de précision. Cependant nous ne pouvons répondre de représenter toujours fidèlement les observations dans ce grand intervalle depuis les Chaldéens jusqu'à nous; nous pouvons encore moins répondre de retrouver avec exactitude les phénomènes arrivés 4592 ans avant nous [We possess to-day excellent instruments; exact observations have been made for some two or three centuries, which already permit us to calculate with considerable accuracy the average motions of the planets; we have the observations of the Chaldeans, of Hipparchus and of Ptolemy, which, owing to their remoteness from the present time, permit us to fix these motions with greater certainty. Still we cannot undertake to represent with invariable accuracy the observations throughout the long period intervening between the Chaldeans and ourselves; and still less can we undertake to determine with exactitude events occurring 4592 years before our day]." — p. xxiii

Cassini and Maier have each determined the secular motion of the moon . . .

p/q: J. S. Bailly, *Traité de l'Astronomie Indienne et Orientale*, 1787: "Cassini & Maier ont établi l'un & l'autre le mouvement séculaire de la lune, & ils diffèrent de 3' 43". Cette différence produiroit en quarante-six siècles, sur le lieu de la lune, une incertitude de près de trois degrés. Sans doute un de ces deux mouvemens est plus exact que l'autre; c'est aux observations très-anciennes à le décider. Mais dans les tems éloignés, où les observations manquent, il résulte de cette différence que nous sommes

incertains des phénomènes. Comment donc auroient fait les Indiens, s'ils étoient modernes dans l'Astronomie, pour remonter de l'an 1491 à l'an 3102 avant notre ère [Cassini and Maier have each determined the secular motion of the moon, and they differ by 3' 43". This difference would give rise in forty-six centuries to an uncertainty of nearly three degrees in the place of the moon. No doubt one of these two determinations is more accurate than the other; and it is for observations of very great antiquity to decide between them. But in very remote periods, where observations are lacking, it follows that we are uncertain as to the phenomena. How, then, could the Hindus have calculated back from the year 1491 A.D. to the year 3102 before our era, if they were only recent students of astronomy]?" — p. xxiii

The Orientals have never been what we are. . . .

p/q: J. S. Bailly, *Traité de l'Astronomie Indienne et Orientale*, 1787: "Les Orientaux n'ont jamais été ce que nous sommes. Quelque bonne opinion que l'examen de leur Astronomie puisse donner de leur savoir, on ne peut supposer qu'ils aient eu jamais ni ce grand appareil d'instrumens qui distingue nos observatoires modernes, & qui est le produit des progrès simultanés de plusieurs arts, ni ce génie des découvertes, qui a paru appartenir jusqu'ici à l'Europe seule, & qui suppléant au tems, fait faire des progrès rapides aux sciences & à l'esprit humain [The Orientals have never been what we are. However high an opinion we may form from the examination of their astronomy, we cannot suppose them ever to have possessed that great array of instruments which distinguishes our modern observatories, and which is the product of simultaneous progress in various arts, nor could they have possessed that genius for discovery, which has hitherto seemed to belong exclusively to Europe, and which, supplying the place of time, causes the rapid progress of science and of the human mind]." — p. xxiv

If the Asiatics have been powerful, learned and wise . . .

p/q: J. S. Bailly, *Traité de l'Astronomie Indienne et Orientale*, 1787: "Si les Asiatiques ont été puissans, savans & sages, la force & le tems ont fait leur mérite & leurs succès dans tous les genres. La force a fondé ou détruit des empires; tantôt elle a élevé des édifices imposans par leur masse, tantôt elle en a fait des ruines respectables; & tandis que ces grandes vicissitudes s'opéroient, la patience accumuloit lentement des connoissances, & une longue expérience produisoit la sagesse. C'est la vieillesse des nations orientales qui a fait leur gloire dans les sciences [If the Asiatics have been powerful, learned and wise, it is power and time which have produced their merit and success of all kinds. Power has founded or destroyed their empires; now it has erected edifices imposing by their bulk, now it has reduced them to venerable ruins; and while these great vicissitudes alternated with each other, patience slowly accumulated knowledge; and prolonged experience produced wisdom. It is the antiquity of the nations of the East which has produced their scientific fame]." — p. xxiv

— 660-1 —

If the Hindus possessed in 1491 a knowledge of the heavenly motions sufficiently accurate . . .

p/q: J. S. Bailly, *Traité de l'Astronomie Indienne et Orientale*, 1787: "Si les Indiens avoient en 1491 une connoissance assez exacte des mouvemens célestes pour remonter à un intervalle de 4592 ans, ils ne pouvoient tenir cette connoissance que des anciennes observations [If the Hindus possessed in 1491 a knowledge of the heavenly motions sufficiently accurate to enable them to calculate backwards for 4,592 years, it follows that they could only have obtained this knowledge from very ancient observations]." — p. xxiv

— 661 —

To grant them such knowledge, while refusing them the observations from which it is derived . . .

p/q: J. S. Bailly, *Traité de l'Astronomie Indienne et Orientale*, 1787: "Leur accorder cette

connoissance, & leur refuser les observations antiques, c'est supposer l'impossible; c'est vouloir qu'en entrant dans la carrière, ils aient cueilli les fruits du tems & de l'expérience; au lieu que si leur époque de l'an 3102 est regardée comme réelle, on voit que, partis de cette époque, les Indiens sont descendus jusqu'à l'an 1491 de notre ère avec les siècles mêmes: c'est le tems qui les a successivement instruits; ils ont bien connu les mouvemens célestes dans ces intervalles, parce qu'ils les ont vus; & la durée de ce peuple sur la terre, est la raison de la fidélité de ses récits & de l'exactitude de ses calculs [To grant them such knowledge, while refusing them the very ancient observations from which it is derived, is to suppose the impossible; it would be equivalent to assuming that at the outset of their career they had already reaped the fruits of time and experience. While on the other hand, if their epoch of 3102 is assumed to be real, we would see that the Hindus had simply kept pace with successive centuries down to the year 1491 of our era. Thus, time itself was their teacher; they knew well the motions of the heavenly bodies during these periods, because they had seen them; and the duration of the Hindu people on earth is the reason for the fidelity of their records and the accuracy of their calculations.]” — pp. xxiv-xxv

It would seem that the problem as to which of the two epochs of 3102 and 1491 . . .

p/q: J. S. Bailly, *Traité de l'Astronomie Indienne et Orientale*, 1787: “La question de savoir quelle est l'époque réelle entre les époques de l'an 3102 & celle de l'an 1491, semble devoir être résolue par une seule considération, c'est que les anciens en général, & les Indiens en particulier . . . n'ont jamais calculé, & par conséquent observé que les éclipses [The question of knowing which of the two epochs of 3102 and 1491 is the real one, seems to be solved by one consideration, viz., that the ancients in general, and particularly the Hindus, calculated, and therefore observed, eclipses only].” — p. xxv

Now, there was no eclipse of the sun at the moment of the epoch 1492 . . .

p/q: J. S. Bailly, *Traité de l'Astronomie Indienne et Orientale*, 1787: “Or il ne se trouve point d'éclipse de soleil au moment de l'époque de 1491; & il n'y a point eu d'éclipse de lune ni quinze jours avant, ni quinze jours après. L'époque de l'an 1491 n'est donc point fondée sur une observation. Quant à celle de l'an 3102, les Brame de Tirvalour la placent au moment du lever du soleil, le 18 Février. Le soleil étoit alors au premier point du zodiaque par sa longitude vraie. Les autres Tables nous sont reconnoître qu'au minuit précédent la lune étoit au même point, mais par sa longitude moyenne. Les Brame nous apprennent en même tems que ce premier point, l'origine de leur zodiaque, étoit l'an 3102 moins avancé de 54° que l'équinoxe. Il en resulte que cette origine étoit alors au sixième degré du Verseau [Now, we do not find an eclipse of the sun at the moment of the epoch 1491; and there had been no eclipse of the moon either 14 days before or after that moment. Therefore the epoch 1491 is not based on an observation. As regards the epoch 3102, the Brahmins of Tirvalur place it at sunrise on February 18th. The sun was then in the first point of the Zodiac according to its true longitude. The other tables show us that at the preceding midnight the moon was in the same place, but according to its average longitude. The Brahmins tell us also that this first point, the origin of their Zodiac, was, in the year 3102, 54 degrees behind the equinox. It follows that that origin was therefore in the sixth degree of Aquarius].” — pp. xxv-xxvi

There occurred, therefore, about this time and place an average conjunction . . .

p/q: J. S. Bailly, *Traité de l'Astronomie Indienne et Orientale*, 1787: “Il y a donc eu vers ce tems, & dans ce point, une conjonction moyenne; les meilleures de nos Tables, favoir, celles de la Caille pour le soleil, & celles de Maïer pour la lune, donnent en effet cette conjonction. Il n'y a point eu alors d'éclipse de soleil, la lune étoit trop éloignée de son nœud; mais quinze jours après, la lune s'en étant rapprochée, a dû s'éclipser. Les Tables de Maïer, employées sans accélération, donnent cette éclipse; seulement elles la font arriver de jour; & le phénomène n'auroit pu être observé dans l'Inde. Les Tables

de Cassini la font arriver la nuit; ce qui montre que le mouvement de Maïer est trop rapide pour les siècles éloignés, lorsqu'on ne tient pas compte de l'accélération; & ce qui prouve en même tems que malgré nos connoissances perfectionnées, nous pouvons être encore dans quelque incertitude sur l'état du ciel dans les tems passés [There occurred, therefore, about this time and place an average conjunction; and indeed this conjunction is given in our best tables: those of La Caille for the sun and of Maier for the moon. There had been no eclipse of the sun, the moon being too distant from her node; but fourteen days later, the moon having approached the node, must have been eclipsed. Maier's tables, used without correction for acceleration, give this eclipse; but they place it during the day; and the phenomenon could not have been observed in India. Cassini's tables give it as occurring at night, which shows that Maier's motions are too rapid for distant centuries, when the acceleration is not allowed for; and which also proves that in spite of our perfected knowledge, we can still be uncertain as to the actual state of the heavens in past times].” — p. xxvi

— 661-2 —

Therefore we believe that as between the two Hindu epochs, the real one is the year 3102 . . .

p/q: J. S. Bailly, *Traité de l'Astronomie Indienne et Orientale*, 1787: “Nous croyons donc qu'entre les deux époques indiennes, l'époque réelle est celle de l'an 3102, parce qu'elle est accompagnée d'une éclipse qui a pu être observée, & qui a dû servir à la déterminer. C'est une première preuve de la vérité des longitudes que les Indiens assignent pour cet instant au soleil & à la lune; & cette preuve suffiroit peut-être si cette ancienne détermination, qui devient très-importante pour la vérification des mouvemens de ces deux astres, ne devoit pas être revêtue de toutes les preuves qui en constatent l'authenticité [Therefore we believe that between the two Hindu epochs, the real one is the year 3102, because it was accompanied by an eclipse which could have been observed, and which must have served to determine it. This is a first proof of the truth of the longitudes which the Hindus assign to the sun and the moon at that instant; and this proof would perhaps be sufficient, were it not that this ancient determination becomes of the greatest importance for the verification of the motions of these two heavenly bodies, and must therefore be borne out by all the proofs that show its authenticity].” — pp. xxvi-xxvii

— 662 —

We notice, first, that the Hindus seemed to have combined two epochs . . .

p/q: J. S. Bailly, *Traité de l'Astronomie Indienne et Orientale*, 1787: “Nous remarquons 1^o. que les Indiens semblent avoir réuni deux époques dans celle de l'an 3102. Les Brames de Tirvalour comptent d'abord du premier instant de l'âge caliougam; puis ils ont une seconde époque placée 2^j 3^h 32' 30" plus tard. Celle-ci est la véritable époque astronomique, l'autre paroît être une époque civile. Mais si cette époque du caliougam n'avoit rien de réel & n'étoit que le résultat d'un calcul, pourquoi seroit-elle ainsi divisée? Leur époque astronomique calculée seroit devenue celle du caliougam, qui auroit été placée dans la conjonction du soleil & de la lune, comme le sont les époques des trois autres Tables. Il faut qu'ils aient eu une raison pour en distinguer deux; & cette raison ne peut appartenir qu'aux circonstances des tems de cette époque: cette époque n'est donc pas un calcul [We notice, first, that the Hindus seem to have combined two epochs together into the year 3102. The Brahmins of Tirvalur reckon primarily from the first moment of the Kali-Yuga age; then they have a second epoch placed 2d. 3h. 32m. 30s. later. The latter is the true astronomical epoch, while the former seems to be a civil era. But if this epoch of the Kali-Yuga had no reality, and was only the result of a calculation, why should it be thus divided? Their calculated astronomical epoch would have become that of the Kali-Yuga, which would have been placed at the conjunction of the sun and the moon, as is the case with the epochs of the three other

tables. They must have had a reason for distinguishing between the two; and this reason can only be due to the circumstances of the time of that epoch; which therefore could not be the result of calculation].”

— p. xxvii

This is not all; starting from the solar epoch determined by the rising of the sun . . .

p/q: J. S. Bailly, *Traité de l’Astronomie Indienne et Orientale*, 1787: “Ce n’est pas tout; en partant de l’époque solaire fixée au lever du soleil . . . le 18 Février de l’an 3102, & remontant de 2^j 3^h 32' 30", on arrivera à 2^h 27' 30" du matin le 16 Février. C’est le moment où commence l’âge caliougam. Il est singulier qu’on n’ait pas fait commencer cet âge à une des quatre grandes divisions qui partagent le jour. On pourroit soupçonner que l’époque doit être à minuit, & que les 2^h 27' 30" sont une réduction de méridiens. Mais quelle que soit la cause de cette fixation, si l’époque étoit le résultat d’un calcul, il auroit été aussi facile de le conduire jusqu’à minuit, pour faire répondre l’époque à une des divisions principales de la journée, & non à un instant marqué par une fraction de jour [This is not all; starting from the solar epoch determined by the rising of the sun . . . on February 18th, 3102, and tracing back events 2d. 3h. 32m. 30s., we come to 2h. 27m. 30s. a.m. of February 16th. This is the instant of the beginning of Kali-Yuga. It is curious that this age had not been made to begin at one of the four great divisions of the day. It might be suspected that the epoch should be at midnight, and that the 2h. 27m. 30s. are a meridian correction. But whatever may have been the reason for fixing on this moment, if the epoch were the result of a calculation, it would have been just as easy to carry it back to midnight, so as to make the epoch correspond to one of the chief divisions of the day, instead of placing it at a moment fixed by a fraction of a day].” — pp. xxvii-xxviii

2nd. . . at the first moment of Kali-Yug there was a conjunction of all the planets . . .

p/q: J. S. Bailly, *Traité de l’Astronomie Indienne et Orientale*, 1787: “2°. Les Indiens disent qu’à l’instant du caliougam il y a eu une conjunction de toutes les planètes; leurs Tables en effet indiquent cette conjunction, & les nôtres montrent qu’elle a pu réellement avoir lieu. Jupiter & Mercure étoient précisément dans le même degré de l’écliptique; Mars s’en éloignoit de huit degrés & Saturne de dix-sept. Il en résulte que vers ce tems ou environ quinze jours après le caliougam . . . les Indiens ont vu quatre planètes se dégager successivement des rayons du soleil; d’abord Saturne, ensuite Mars, puis Jupiter & Mercure, & ces planètes se sont montrées réunies dans un assez petit espace. Quoique Vénus n’y parût pas, le goût du merveilleux y a fait placer une conjunction générale de toutes les planètes. Le témoignage des Brames est ici d’accord avec celui de nos Tables; & ce témoignage, qui résulte d’une tradition, doit être fondé sur une véritable observation [2nd. The Hindus say that at the first moment of Kali-Yuga, there was a conjunction of all the planets; and their tables show this conjunction, while ours indicate that it might actually have occurred. Jupiter and Mercury were in exactly the same degree of the ecliptic; Mars being 8 degrees and Saturn 17 degrees distant from it. It follows that about this time, or some fourteen days after the Kali-Yuga (began) . . . the Hindus saw four planets emerge successively from the Sun’s rays; first Saturn, then Mars, then Jupiter and Mercury, and these planets appeared united in a somewhat small space. Although Venus had not appeared there, the taste for the marvellous caused it to be called a general conjunction of all the planets. The testimony of the Brahmins here coincides with that of our tables; and this evidence, the result of a tradition, must be founded on actual observation].” — p. xxviii

— 663 —

3rd. We may remark that this phenomenon was visible about a fortnight after the epoch . . .

p/q: J. S. Bailly, *Traité de l’Astronomie Indienne et Orientale*, 1787: “3°. Remarquons que ce phénomène a été visible environ quinze jours après l’époque, & précisément dans le tems où a dû être

observée l'éclipse de lune qui a réglé cette époque. Ces deux observations se confirment donc mutuellement; qui a fait l'une doit avoir fait l'autre [3rd. We may remark that this phenomenon had been visible about a fortnight after the epoch, and exactly at the time when the eclipse of the moon must have been observed, which served to fix this epoch. These two observations mutually confirm each other; and whoever made the one must have made the other also].” — pp. xxviii-xxix

4th. We may believe also that the Hindus made at the same time a determination . . .

p/q: J. S. Bailly, *Traité de l'Astronomie Indienne et Orientale*, 1787: “4°. On peut croire encore que les Indiens ont fait dans le même tems une détermination du lieu du nœud de la lune; leur calcul semble l'indiquer. Ils donnent la longitude de ce point de l'orbite lunaire pour le tems de leur époque, puis ils y ajoutent une quantité constante de 40', qui est le mouvement du nœud en 12^j 14^h. C'est comme s'ils déclaroient que cette détermination a été faite treize jours après leur époque, & que pour qu'elle réponde à leur époque même, il faut y ajouter 40' dont le nœud a rétrogradé dans l'intervalle. Cette observation est donc encore de la même date que celle de leur éclipse de lune; & voilà trois observations qui se rendent mutuellement témoignage [4th. We may believe also that the Hindus made at the same time a determination of the place of the moon's node; this seems indicated by their calculation. They give the longitude of this point of the lunar orbit for the time of their epoch, and to this they add as a constant 40m., which is the node's motion in 12d. 14h. It is as if they stated that this determination was made 13 days after their epoch, and that to make it correspond to their epoch, we must add the 40m. through which the node has retrograded in the interval. This observation is, therefore, of the same date as that of their lunar eclipse; thus giving three observations, which are mutually confirmatory].” — p. xxix

5th. It appears from the description of the Hindu Zodiac . . .

p/q: J. S. Bailly, *Traité de l'Astronomie Indienne et Orientale*, 1787: “5°. Il résulte de la description que M. le Gentil nous a donnée du zodiaque indien, que l'on peut y déterminer les lieux des étoiles nommées l'Œil du Taureau & l'Epi de la Vierge pour le commencement de l'âge caliougam. Or, en comparant ces positions aux positions actuelles, réduites par notre précession des équinoxes au tems de l'époque, on voit que l'origine du zodiaque indien doit être entre le cinquième & le sixième degré du Verseau. Les Brames ont donc raison de la placer au sixième degré de ce signe; d'autant que la différence assez petite peut appartenir au mouvement propre & inconnu de ces étoiles. C'est donc encore une observation qui a guidé les Indiens dans cette détermination assez exacte du premier point de leur zodiaque mobile [5th. It follows from the description of the Hindu Zodiac given by G. Le Gentil, that on it the places of the stars named The Eye of Taurus and the Wheat Ear of Virgo can be determined for the beginning of the Kali-Yuga. Now, comparing these places with the actual positions, reduced by our precession of the equinoxes to the moment of the epoch, we see that the point of origin of the Hindu zodiac must lie between the fifth and sixth degree of Aquarius. The Brahmins, therefore, were right in placing it in the sixth degree of that sign, the more so since this small difference may be due to the proper motion of these stars which is unknown. Thus it was yet another observation which guided the Hindus in this fairly accurate determination of the first point of their movable zodiac].” — pp. xxix-xxx

It does not seem possible to doubt the existence in antiquity of observations of this date. . . .

p/q: J. S. Bailly, *Traité de l'Astronomie Indienne et Orientale*, 1787: “Qu'il y ait des observations de cette date dans l'antiquité, c'est ce dont il ne semble pas possible de douter. Les Perses disent que quatre belles étoiles ont été établies pour garder les quatre coins du monde. Or il se rencontre qu'au tems du commencement de l'âge caliougam, 3000 ou 3100 ans avant notre ère, l'Œil du Taureau & le Cœur du Scorpion étoient précisément dans les équinoxes, le Cœur du Lion & le Poisson austral assez près des solstices. Une observation du lever des Pleïades le soir, sept jours avant l'équinoxe d'automne, appartient encore à l'an 3000 avant notre ère. Cette observation & celles de la même espèce, qui ont été

recueillies dans les calendriers de Ptolémée, sans qu'il en ait nommé les auteurs, ces observations, qui sont plus anciennes que celles des Chaldéens, pourroient bien être l'ouvrage des Indiens. Ils connoissent parfaitement la constellation des Pleïades, & tandis que nous la nommons vulgairement la *Poussinière*, ils la nomment *Pillalou codi*, les petits & la poule [It does not seem possible to doubt the existence in antiquity of observations of this date. The Persians say that four beautiful stars were placed as guardians at the four corners of the world. Now it so happens that at the beginning of Kali Yuga, 3000 or 3100 years before our era, the Eye of the Bull and the Heart of the Scorpion were exactly at the equinoctial points, while the Heart of the Lion and the Southern Fish were close enough to the solstitial points. An observation of the rising of the Pleiades in the evening, seven days before the autumnal equinox, also belongs to the year 3000 before our era. This and similar observations which were collected in Ptolemy's calendars, though he does not name their authors, these observations, which are much older than those of the Chaldeans, may well be the work of the Hindus. They are well acquainted with the constellation of the Pleiades, and while we call it vulgarly the 'Poussinière,' they name it: *Pillaloo-codi* — the 'Hen and chickens'].” — p. xxx

— 663-4 —

This name has therefore, passed from people to people . . .

p/q: J. S. Bailly, *Traité de l'Astronomie Indienne et Orientale*, 1787: “Ce nom a donc passé de peuple en peuple, & nous vient des plus anciennes nations de l'Asie. On reconnoît que les Indiens ont dû observer le lever des Pleïades, & s'en servir pour régler leurs années & leurs mois; car cette constellation est aussi nommée chez eux *Cartiguy*. Or ils ont un mois qui porte le même nom; & cette conformité n'a pu avoir lieu que parce que le tems de ce mois étoit annoncé par le lever ou le coucher de la constellation. Mais ce qui est plus décisif pour montrer que les Indiens ont observé les étoiles, & de la même manière que nous, en désignant leur position par leur longitude, c'est qu'Augustin Riccius rapporte que, suivant des observations attribuées à Hermès & faites 1985 ans avant Ptolémée, l'étoile brillante de la Lyre & celle du Cœur de l'Hydre étoient plus avancées chacune de sept degrés qu'au tems de cet Astronôme [This name has therefore passed from people to people, and comes to us from the most ancient nations of Asia. We see that the Hindus must have observed the rising of the Pleiades, and have made use of it to regulate their years and their months; for this constellation is also called *Krittika*. Now they have a month of the same name; and this coincidence can only be due to the fact that this month was announced by the rising or setting of the constellation. But what is even more decisive for showing that the Hindus observed the stars, and in the same way that we do, marking their position by their longitude, is a fact mentioned by Augustinus Riccius that, according to observations attributed to Hermes, and made 1,985 years before Ptolemy, the brilliant star in the Lyre and that in the Heart of the Hydra were each seven degrees in advance of their respective positions in the time of that astronomer].” — pp. xxx-xxxi

— 664 —

This determination seems very extraordinary. The stars advance regularly . . .

p/q: J. S. Bailly, *Traité de l'Astronomie Indienne et Orientale*, 1787: “Cette détermination paroît fort extraordinaire. Les étoiles avancent constamment à l'égard de l'équinoxe; Ptolémée devoit trouver les longitudes plus grandes de 28 degrés qu'elles ne l'étoient 1985 ans avant lui. Il y avoit même dans ce fait une circonstance singulière; on retrouvoit la même erreur ou la même différence sur le lieu des deux étoiles; cette différence appartenoit donc à une cause qui les affectoit toutes deux également. C'est pour expliquer cette singularité, que l'Arabe Thebith imagina que les étoiles avoient un mouvement d'oscillation, qui les faisoit tantôt avancer & tantôt reculer [This determination seems very

extraordinary. The stars advance regularly with respect to the equinox; and Ptolemy ought to have found the longitudes 28 degrees in excess of what they were 1985 years before his time. Besides, there is a remarkable peculiarity about this fact; the same error or difference was found in the position of both stars; therefore that difference was due to some cause that affected both stars equally. It was to explain this peculiarity that the Arab Thābit imagined that the stars had an oscillatory movement, causing them to advance and recede alternately.” — p. xxxi

This hypothesis was easily disproved . . .

p/q: J. S. Bailly, *Traité de l’Astronomie Indienne et Orientale*, 1787: “Cette hypothèse a été facilement détruite; mais les observations attribuées à Hermès restoient sans explication. Cette explication se rencontre dans l’Astronomie indienne. Au tems marqué de ces observations, 1985 ans avant Ptolémée, l’origine du zodiaque indien précédoit l’équinoxe de 35 degrés; les longitudes qui y étoient comptées, étoient donc de 35 degrés plus avancées que celles qui sont comptées de l’équinoxe. Mais après 1985 ans écoulés, les étoiles ayant avancé de 28 degrés, il ne se trouve plus que 7 degrés de différence entre les longitudes de Ptolémée & celles d’Hermès, & la différence est la même pour les deux étoiles, parce qu’elle appartient à la différence des origines du zodiaque indien & du zodiaque de Ptolémée qui commence à l’équinoxe. Cette explication est si simple & si naturelle, qu’elle ne peut manquer d’être vraie. Nous ignorons si l’Hermès, célèbre dans l’antiquité, a été Indien, mais nous voyons que les observations, qui lui sont attribuées, sont notées à la manière indienne; nous en concluons que ce sont des Indiens qui les ont faites: ils ont par consequent pu faire toutes les observations que nous venons de détailler & que leurs Tables nous ont fait connoître [This hypothesis was easily disproved; but the observations attributed to Hermes remained unexplained. This explanation is found again in Hindu astronomy. At the date fixed for these observations, 1985 years before Ptolemy, the first point of the Hindu Zodiac was 35 degrees in advance of the equinox; therefore the longitudes reckoned for this point were 35 degrees in excess of those reckoned from the equinox. But after the lapse of 1985 years the stars would have advanced 28 degrees, and there would remain a difference of only 7 degrees between the longitudes of Ptolemy and those of Hermes, and the difference would be the same for the two stars, since it is due to the difference between the starting-points of the Hindu zodiac and that of Ptolemy, which begins at the equinox. This explanation is so simple and so natural that it must be true. We do not know whether Hermes, so celebrated in antiquity, was a Hindu, but we see that the observations, which are attributed to him, are reckoned in the Hindu manner, and we conclude that they were made by the Hindus: therefore, they were able to make all the observations we have enumerated, and which we find noted in their tables].” — pp. xxxi-xxxii

6th. The observation of the year 3102, which seems to have fixed their epoch . . .

p/q: J. S. Bailly, *Traité de l’Astronomie Indienne et Orientale*, 1787: “6°. L’observation de l’an 3102 qui paroît avoir fondé l’époque, n’a pas été difficile à faire. On apperçoit que les Indiens, lorsqu’ils ont connu le mouvement journalier de la lune de 13° 10' 35", s’en sont servis pour diviser le zodiaque en 27 constellations, relativement à la lune qui employe environ 27 jours à le parcourir [6th. The observation of the year 3102, which seems to have fixed the epoch, was not a difficult one to make. We see that the Hindus, when they knew the moon’s daily motion of 13° 10' 35", made use of it to divide the zodiac into 27 constellations, related to the period of the moon, which takes about 27 days to describe it].” — p. xxxii

— 665 —

It was by this method that they determined the positions of the stars in this Zodiac . . .

p/q: J. S. Bailly, *Traité de l'Astronomie Indienne et Orientale*, 1787: "C'est par ce moyen qu'ils ont déterminé le lieu des étoiles dans ce zodiaque; c'est ainsi qu'ils ont trouvé que la Claire de la Lyre étoit dans 8^s 24°, le Cœur de l'Hydre dans 4^s 7°: longitudes attribuées à Hermès, mais qui sont comptées dans le zodiaque indien. C'est ainsi qu'ils ont encore reconnu que l'Epi de la Vierge faisoit le commencement de leur quinzième constellation, & l'Œil du Taureau la fin de la quatrième; ces étoiles étant, l'une dans 6^s 6° 40', & l'autre dans 1^s 23° 20' du zodiaque indien. Cela posé, l'éclipse de lune arrivée quinze jours après l'époque caliougam, a eu lieu dans un point placé entre l'Epi de la Vierge & l'étoile θ de la même constellation. Ces étoiles sont éloignées assez précisément de l'intervalle d'une constellation; l'une commence la quinzième, l'autre la seizième. Il n'a donc pas été difficile de déterminer le lieu de la lune, en mesurant sa distance à l'une de ces deux étoiles; on a conclu le lieu du soleil qui est opposé: & puis par la connoissance des moyens mouvemens, on a calculé que la lune avoit été au point de l'origine de ce zodiaque par sa longitude moyenne au minuit entre le 17 & le 18 Février de l'an 3102 avant notre ère, & que le soleil s'y étoit trouvé six heures après par sa longitude vraie; circonstance qui fixe le commencement de l'année indienne [It was by this method that they determined the position of the stars in this zodiac; it was thus they found that the bright star of the Lyre was in 8s 24°, the Heart of the Hydra in 4s 7°, longitudes which are ascribed to Hermes, but which are calculated on the Hindu zodiac. Similarly, they discovered that the 'Wheat Ear of Virgo' formed the beginning of their fifteenth constellation, and the 'Eye of Taurus' the end of the fourth; these stars being the one in 6s 6° 40', the other in 1s 23° 20' of the Hindu zodiac. This being so, the eclipse of the moon which occurred 14 days after the Kali-Yuga epoch, took place at a point between the 'Wheat Ear' of Virgo and the star θ of the same constellation. These stars are exactly distanced at the period of a constellation, the one beginning the fifteenth, the other the sixteenth. Thus it would not be difficult to determine the moon's place by measuring her distance to one of these two stars; from this they deduced the position of the sun, which is opposite to the moon, and then, by knowing their average motions, they calculated that the moon had been at the point of origin of that zodiac according to her average longitude at midnight between the 17th and the 18th of February of the year 3102 before our era, and that the sun had occupied the same place six hours later according to its true longitude; an event which fixes the beginning of the Hindu year].” — pp. xxxii-xxxiii

7th. The Hindus state that 20,400 years before the age of the Kali . . .

p/q: J. S. Bailly, *Traité de l'Astronomie Indienne et Orientale*, 1787: "7°. Les Indiens établissent que l'an 20400 avant l'âge caliougam, l'origine de leur zodiaque répondoit à l'équinoxe du printemps, & que le soleil & la lune y étoient en conjonction. Il est bien visible que cette époque est fictive; mais on peut chercher de quel point, de quelle époque les Indiens sont partis pour l'établir. Si l'on prend la révolution indienne du soleil 365^j 6^h 12' 30", & celle de la lune 27^j 7^h 43' 13".

20400 révolutions du soleil sont 7451277^j 2^h

272724 révolutions de la lune 7451277 7

[7th. The Hindus state that 20,400 years before the age of Kali Yuga, the first point of their zodiac coincided with the vernal equinox, and that the sun and moon were in conjunction there. This epoch is obviously fictitious; but we may inquire from what point, from what epoch, the Hindus set out in establishing it. If we take the Hindu values for the revolution of the sun, viz., 365d. 6h. 12m. 30s., and those of the moon, 27d. 7h. 43m. 13s., we have —

20,400 revolutions of the sun 7,451,277d. 2h.

272,724 revolutions of the moon 7,451,277 7]” — pp. xxxiii-xxxiv

Such is the result obtained by starting from the Kali Yuga epoch . . .

p/q: J. S. Bailly, *Traité de l'Astronomie Indienne et Orientale*, 1787: “Voilà ce qu'on trouve en partant de l'époque du caliougam; & l'assertion des Indiens, qu'il y a eu alors une conjonction, est en effet fondée sur leurs Tables; mais si, en employant les mêmes élémens, on part des époques de l'an 1491, ou d'une autre placée en 1282, dont nous parlerons dans la suite, on trouvera presque un ou deux jours de différence. Il est naturel & juste, en vérifiant le calcul des Indiens, de prendre ceux de leurs élémens qui donnent le même résultat que le leur, & de partir de celle de leurs époques qui fait retrouver l'époque fictive. Or, comme pour établir ce calcul, ils ont dû partir de leur époque réelle, de celle qui étoit fondée sur une observation, & non pas de celles qui en ont été dérivées par le calcul même, il s'ensuit que leur époque réelle est celle de l'an 3102 avant notre ère [Such is the result obtained by starting from the Kali Yuga epoch; and the assertion of the Hindus, that there had been a conjunction at the time stated, is founded on their tables; but if, using the same elements, we start from the epoch of the year 1491, or from another placed in the year 1282, of which we shall speak later, there will always be a difference of almost one or two days. It is just and natural, in verifying the Hindu calculations, to take those among their elements which give the same result as they had themselves arrived at, and to set out from that one among their epochs which enables us to arrive at the fictitious epoch. Hence, since to make this calculation they must have set out from their real epoch, the one which was founded on an observation and not from any of those which were derived by this very calculation from the former, it follows that their real epoch is that of the year 3102 before our era].” — p. xxxiv

8th. The Tiravalore Brahmins give the Moon's motion as 7d. 2h. 8m. . . .

p/q: J. S. Bailly, *Traité de l'Astronomie Indienne et Orientale*, 1787: “8°. Les Brame de Tirvalour nous donnent le mouvement de la lune de 7^s 2° 0' 7" dans le zodiaque mobile, ou de 9^s 7° 45' 1" relativement à l'équinox dans un grand intervalle de 1600984 jours ou de 4383 ans 94 jours. Nous croyons que ce mouvement a été déterminé par observation. Nous dirons d'abord que cet intervalle a une étendue qui le rend peu commode pour . . . le calcul des moyens mouvemens [8th. The Brahmins of Tiravalur give us the moon's motion as 7s 2° 0' 7" on the movable zodiac, and as 9s 7° 45' 1" as referred to the equinox in a great period of 1,600,984 days, or 4,383 years and 94 days. We believe that this motion was determined by observation. We will say at the outset that this period is of an extent which renders it but ill suited to . . . the calculation of the mean motions].” — pp. xxxiv-xxxv

In their astronomical calculations the Hindus make use of periods . . .

p/q: J. S. Bailly, *Traité de l'Astronomie Indienne et Orientale*, 1787: “Les Indiens employent dans leurs calculs astronomiques des intervalles de 248, 3031, 12372 jours; mais indépendamment de ce que ces intervalles, beaucoup plus courts, n'ont pas l'incommodité du premier, c'est qu'ils renferment un nombre complet de révolutions de la lune à l'égard de son apogée. Ce sont réellement des moyens mouvemens. Le grand intervalle de 1600984 jours n'est point une somme de révolutions accumulées; il n'y a point de raison pour qu'il embrasse plutôt 1600984 que 1600985 jours. Il semble que l'observation seule doit avoir décidé du nombre de jours, & en avoir marqué le commencement & la fin. Cet intervalle finit le 21 Mai de l'an 1282 de notre ère à 5^h 15' 30" à Bénarès. La lune étoit alors dans son apogée, suivant les Indiens, &

avoit de longitude	7 ^s 13° 45' 1"
Maïer donne au même instant	7 13 53 48
& il place l'apogée	7 14 6 54

[In their astronomical calculations the Hindus make use of periods of 248, 3031, and 12,372 days; but apart from the fact that these periods, though much too short, do not present the inconvenience of the

former, they contain an exact number of revolutions of the moon with respect to its apogee. They are in reality mean motions. The great period of 1,600,984 is not a sum of accumulated revolutions; there is no reason why it should contain 1,600,984 rather than 1,600,985 days. It seems that observation alone must have fixed the number of days and marked the beginning and the end. This period ends on the 21st of May, 1282, of our era at 5h 15' 30" at Benares. The moon was then in her apogee, according to the Hindus, and

her longitude was $7^{\circ}13'45''1''$

Maier gives the longitude as 7 13 53 48

and places the apogee at 7 14 6 54].” — p. xxxv

The determination of the moon’s place by the Brahmins . . .

p/q: J. S. Bailly, *Traité de l’Astronomie Indienne et Orientale*, 1787: “La détermination des Brame ne diffère donc que de huit à neuf minutes sur le lieu de la lune, & de vingt-deux min. sur celui de l’apogée; & il est bien évident qu’ils n’ont pu obtenir cet accord avec nos meilleures Tables & cette exactitude dans le ciel que par observation. Si l’observation a en effet déterminé la fin de l’intervalle, il y a tout lieu de croire que c’est une semblable observation qui en a marqué le commencement. Mais alors ce mouvement, déterminé directement & pris dans la nature, doit avoir une grande conformité avec les vrais mouvemens célestes [The determination of the moon’s place by the Brahmins thus differs only by eight or nine minutes from ours, and that of the apogee by twenty-two minutes, and it is very evident that they could only have obtained this agreement with our best tables and this exactitude in the celestial positions by observation. If then, observation fixed the end of this period, there is every reason to believe that a similar observation marked the beginning of it. But then this motion, determined directly, and taken from nature, would of necessity be in close agreement with the true motions of the heavenly bodies].” — pp. xxxv-xxxvi

And in fact the Hindu motion during this long period of 4,883 years, does not differ by a minute . . .

p/q: J. S. Bailly, *Traité de l’Astronomie Indienne et Orientale*, 1787: “En effet le mouvement indien dans ce long intervalle de 4383 ans, ne diffère pas d’une minute de celui de Cassini; il est également conforme à celui des Tables de Maïer. Ainsi deux peuples, les Indiens & les Européens, placés aux deux extrémités du monde, & par des institutions peut-être aussi éloignées dans le tems, ont obtenu précisément les mêmes résultats quant au mouvement de la lune, & une conformité qui ne seroit pas concevable, si elle n’étoit pas fondée sur l’observation & sur une imitation réciproque de la nature. Remarquons que les quatre Tables des Indiens sont toutes les copies d’une même Astronomie [And in fact the Hindu motion during this long period of 4,883 years, does not differ by a minute from that of Cassini, and agrees equally with that of Maier’s tables. Thus two peoples, the Hindus and the Europeans, placed at the two ends of the world, and perhaps just as distant by their institutions, have obtained precisely the same results as regards the moon’s motions; and an agreement which would not be conceivable, if it were not based on the observation and mutual imitation of nature. We must remark that the four tables of the Hindus are all copies of the same astronomy].” — p. xxxvi

It cannot be denied that the Siamese tables existed in 1687, when they were brought from India . . .

p/q: J. S. Bailly, *Traité de l’Astronomie Indienne et Orientale*, 1787: “On ne peut nier que les Tables de Siam n’existassent en 1687, dans le tems que M. de la Loubere les rapporta de l’Inde. A cette époque les Tables de Cassini & de Maïer n’existoit pas; les Indiens avoient déjà le mouvement exact que renferment ces Tables, & nous ne l’avions pas encore. Il faut donc convenir que l’exactitude de ce mouvement indien est le fruit de l’observation. Il est exact dans cette durée de 4383 ans, parce qu’il a

été pris sur le ciel même; & si l'observation en a déterminé la fin, elle en a marqué également le commencement. C'est le plus long intervalle qui ait été observé & dont le souvenir se soit conservé dans les fastes de l'Astronomie. Il a son origine dans l'époque de 3102, & il est une preuve démonstrative de la réalité de cette époque [It cannot be denied that the Siamese tables existed in 1687, in the time when De la Loubère brought them back from India. At that time period the tables of Cassini and Maier did not exist, and the Hindus were already in possession of the exact motion contained in these tables, while we did not yet possess it. It must, therefore, be admitted that the accuracy of this Hindu motion is the result of observation. It is exact throughout this period of 4,383 years, because it was taken from the sky itself; and if observation determined the end of it, it also fixed its beginning. It is the longest period which had been observed and of which the recollection is preserved in the annals of astronomy. It has its origin in the epoch of the year 3102, B.C., and it is a demonstrative proof of the reality of that epoch].” — pp.

The following is an answer to those men of science who might suspect that our Astronomy . . .

p/q: J. S. Bailly, *Traité de l'Astronomie Indienne et Orientale*, 1787: “Ceci répond aux Savans qui pourroient soupçonner que notre Astronomie a été portée dans l'Inde & communiquée aux Indiens par nos Missionnaires. 1°. L'Astronomie indienne a des formes qui lui sont propres, des formes qui caractérisent l'originalité; si c'étoit notre Astronomie que l'on eût traduire, il auroit fallu beaucoup d'art & de science pour déguiser ainsi le larcin. 2°. En adoptant le moyen mouvement de la lune, on auroit adopté également l'obliquité de l'écliptique, l'équation du centre du soleil, la durée de l'année; ces élémens diffèrent absolument des nôtres, ils sont singulièrement exacts lorsqu'ils appartiennent à l'époque de l'an 3102; ils feroient très-erronés s'ils avoient été établis dans le siècle dernier. 3°. enfin nos Missionnaires n'ont pu communiquer aux Indiens en 1687 le moyen mouvement de la lune des Tables de Cassini qui n'existoient pas alors, ils ne pouvoient connoître que les moyens mouvemens de Tycho, de Riccioli, de Copernic, de Bouillaud, Képler, Longomontanus, ou ceux des Tables d'Alphonse [The following is an answer to those scientists who might suspect that our astronomy had been carried to India and communicated to the Hindus by our Missionaries. 1st. Hindu astronomy has its own peculiar forms, forms which characterized its originality; if it had been our astronomy that had been translated, great skill and knowledge would have been needed to disguise the theft. 2nd. When adopting the mean movement of the moon, they would have adopted also the inclination of the ecliptic, the equation of the sun's centre, the length of the year; these elements differ completely from ours, and are remarkably accurate when they are applied to the epoch of 3102; while they would be exceedingly erroneous if they had been established in the last century. 3rd, finally, our missionaries could not have communicated to the Hindus in 1687 the mean motions of the moon in the tables of Cassini, which then did not exist, they could have known only the mean motions of Tycho, Riccioli, Copernicus, Bouillaud, Kepler, Longomontanus, and those of the tables of Alphonso].” — pp. xxxvi-xxxvii fn.

I will now give a tabular view of these mean motions for 4383 years and 94 days . . .

p/q: J. S. Bailly, *Traité de l'Astronomie Indienne et Orientale*, 1787: “Je vais présenter ici le tableau de ces moyens mouvemens pour 4383 ans & 94 jours.

TABLE	Moy. mouv.	Dif. avec les Ind.
-------	------------	--------------------

d'Alphonse	9 ^s 7° 2' 47"	− 0° 42' 14"
Copernic	9 6 2 13	− 1 42 48
Tycho	9 7 54 40	+ 0 9 39
Képler	9 6 57 35	− 0 47 26
Longomontanus	9 7 2 13	− 0 42 48
Bouillaud	9 6 48 8	− 0 58 53
Riccioli	9 7 53 57	+ 0 8 56
Cassini	9 7 44 11	− 0 0 50
Indiens	9 7 45 1	

On voit qu'aucun de ces moyen mouvemens, celui de Cassini excepté, ne s'accorde avec le mouvement donné par les Indiens. On n'a donc point emprunté ces moyens mouvemens. Il n'y a de conformité qu'avec le mouvement de Cassini, dont les Tables n'existoient pas en 1687. Ce mouvement de la lune appartient donc aux Indiens, & ils n'ont pu l'obtenir que de l'observation.

[I will now give a tabular view of these mean motions for 4383 years and 94 days:

TABLE	Mean Motion	Diff. from Hindu
Alphonso	9 ^s 7° 2' 47"	− 0° 42' 14"
Copernicus	9 6 2 13	− 1 42 48
Tycho	9 7 54 40	+ 0 9 39
Kepler	9 6 57 35	− 0 47 26
Longomontanus	9 7 2 13	− 0 42 48
Bouillaud	9 6 48 8	− 0 58 53
Riccioli	9 7 53 57	+ 0 8 56
Cassini	9 7 44 11	− 0 0 50
Indian	9 7 45 1	

We see that none of these mean motions, except Cassini's, agree with the motion given by the Hindus. They therefore did not borrow their mean motions. There is an agreement only with those of Cassini, whose tables did not exist in 1687. This mean motion of the moon belongs, therefore, to the Hindus, and they could only have obtained it by observation].” — p. xxxvii fn.

The grain of sand, gentlemen, has been studied by science for four thousand years, science has looked at it, she has turned it and turned it again; she divides it and subdivides it; she torments it with her experiments; she vexes it with her calculations to snatch from it the final word as to its inner constitution; she asks it, with a curiosity that does not manage to satisfy: ‘Shall I divide you ad infinitum?’ And suspended over this abyss, science hesitates, she stumbles, she feels dazzled, she becomes dizzy, and she finally says: *I do not know*].’ ” — p. xix

p/q: John Tyndall, *Fragments of Science for Unscientific People*, 1871: “This first marshalling of the atoms on which all subsequent action depends baffles a keener power than that of the microscope. Through pure excess of complexity, and long before observation can have any voice in the matter, the most highly-trained intellect, the most refined and disciplined imagination, retires in bewilderment from the contemplation of the problem. We are struck dumb by an astonishment which no microscope can relieve, doubting not only the power of our instrument, but even whether we ourselves possess the intellectual elements which will ever enable us to grapple with the ultimate structural energies of Nature.” — pp. 153-4

For all the various parts of the universe are filled, as the earth also is complete and full of bodies, differing in quality and in form, having their species and their magnitude, one larger, one smaller, one solid, one tenuous. The larger and more solid are easily perceived; the smaller and more tenuous are difficult to apprehend, or altogether invisible. We know only of their existence by the sensation of feeling, wherefore many persons deny such entities to be bodies, and regard them as simply spaces, but it is impossible there should be such spaces. For if indeed there should be anything outside the universe . . . then it would be a space occupied by intelligent beings analogous to its Divinity . . . The supreme Being of heaven, or of all that is comprehended under this name, is Zeus, for it is by heaven that Zeus gives life to all things. The supreme Being of the sun is light, for it is by the disk of the sun that we receive the benefit of the light. Le dieu unique n’est que le dieu du nome ou de la ville, *noutir noutti*, qui n’exclut pas l’existence du dieu unique de la ville ou du nome voisin. En résumé, ce n’est pas du dieu unique de l’Égypte qu’on devrait parler, quand on traite du monothéisme égyptien, mais des dieux uniques de l’Égypte [If the Egyptian of Memphis proclaimed the unity of Phtah to the exclusion of Ammon, the Egyptian of Thebes proclaimed the unity of Ammon to the exclusion of Phtah. Modern science insists upon the doctrine of evolution . . .

p/Q: H. P. Blavatsky, *Isis Unveiled*, 1877: “Modern science insists upon the doctrine of evolution; so do human reason and the ‘secret doctrine,’ and the idea is corroborated by the ancient legends and myths, and even by the Bible itself when it is read between the lines. We see a flower slowly developing from a bud, and the bud from its seed. But whence the latter, with all its predetermined programme of physical transformation, and its invisible, therefore *spiritual* forces which gradually develop its form, color, and odor? The word *evolution* speaks for itself. The germ of the present human race must have preëxisted in the parent of this race, as the seed, in which lies hidden the flower of the next summer, was developed in the capsule of its parent-flower; the parent may be but *slightly* different, but it still differs from its future progeny.” — 1:152-3

While it is positively absurd to believe the ‘transformation of species’ to have taken place according to some of the more materialistic views of the evolutionists, it is but natural to think that each genus, beginning with the mollusks and ending with monkey-man, has modified from its own primordial and distinctive form.” — 1:153

p/q: Auguste Le Plongeon, *Sacred Mysteries among the Mayas and Quiches*, 1886: “SEVEN seems to have been the sacred number *par excellence* among all civilized nations of antiquity. Why? This query has never been satisfactorily answered. Each separate people has given a different explanation, according to the peculiar tenets of their religion. That it was the number of numbers for those initiated to the sacred mysteries there can be no doubt. Pythagoras, who had borrowed his ideas on numbers from the Egyptians, calls it the ‘Vehicle of life,’ containing body and soul, since it is formed of a quaternary, that is: *Wisdom and Intellect*; and a *trinity* or *action* and *matter*. Emperor Julian, in *Matrem* [*Hymn to the Mother of the Gods*, § 173] and in *Oratio*, expresses himself thus: ‘Were I to touch upon the initiation into our secret mysteries, which the Chaldees bacchised, respecting the *seven-rayed* god, lighting up the soul through him, I should say things unknown to the rabble, very unknown, but well-known to the blessed Theurgists.’ ” — p. 143

“**But this last ratio is but a modified form of light . . .**”

p/q: J. Ralston Skinner, “Cabbalah — VI,” June 1886: “But this last ratio is but a modified form of Light, or 20612 to 6561, as a *pi value*, being only a variation of the same (that is 20612 to 6561 is 31415 to one, and 355 to 113 is 31415 to one, or Alhim or God), — and in such a manner that one can be made to flow into and be derived from the other: — and these are the three steps by which the *Unity* and sameness can be shown of the Divine names. That is, the two are but variations of a same ratio, viz., that of *pi*. 1,955,844,687 years
1,664,500,987 "
1,960,852,987 "

And further, let us look at the three last figures in these three numbers of years:

687
987
987

The full period of one Manvantara . . . 14 “Manvantaras” plus the period of one Sâtya Yuga . . .

SEE: John Bentley, “Remarks on the Principal Æras and Dates of the Ancient Hindus,” 1799: “The *Calpa* is the greatest of all the astronomical periods, and the duration of it is 4320000000 years. This period is composed, or made up, of the lesser *yugs*, &c. in the following manner. 4 *Yugs*, viz. a *Satya*, a *Treta*, a *Dwapar*, and a *Cali yug*, make one divine age or *Maha yug*; 71 *Maha yugs*, with a *Sandhi* [transition period], equal to a *Satya yug*, make 1 *Manwantara*; and 14 *Manwantaras* compose a *Calpa* . . . The duration of each . . . *Manwanatara* – 308448000 [years] . . .” — p. 316 (*Asiatic Researches*, v. 5)

Therefore a *Maha-Yuga* consists of . . . 4,320,000 years.

SEE: *Vishṇu Purāṇa*, tr. Wilson, ed. Hall, 1864-77: “If these divine years are converted into years of mortals, by multiplying them by 360 (a year of men being a day of the gods), we obtain the years of which the *Yugas* of mortals are respectively said to consist:

4800 x 360 = 1.728.000 [Kṛita Yuga]

3600 x 360 = 1.296.000 [Tretā Yuga]

2400 x 360 = 864.000 [Dwāpara Yuga]

1200 x 360 = 432.000 [Kali Yuga]

360 days of mortals make a year . . .

r/q: Mabel Collins & P. Sreenevas Row, “Light on the Path — III,” Nov. 1885:
“Mortal years.

360 days of mortals make a year	1
Krita Yuga contains	1,728,000
Treta Yuga contains	1,296,000
Dwapara Yuga contains	864,000
Kali Yuga contains	432,000
The total of the said four Yugas constitute a Maha Yuga	4,320,000
Seventy-one of such Maha Yugas form the period of the reign of one Manu	306,720,000
The reign of 14 Manus embraces the duration of 994 Maha Yugas, which is equal to	4,294,080,000
Add <i>Sandhis</i> , <i>i.e.</i> , intervals between the reign of each Manu, which amount to 6 Maha Yugas, equal to	25,920,000
The total of these reigns and interregnums of 14 Manus, is 1,000 Maha Yugas, which consti- tute a Kalpa, <i>i.e.</i> , one day of Brahma, — equal to	4,320,000,000
As Brahma’s night is of equal duration, one day and night of Brahma will contain	8,640,000,000
360 of such days and nights make one year of Brahma, equal to	3,110,400,000,000
100 of such years constitute the whole period of Brahma’s age <i>i.e.</i> , Maha Kalpa	311,040,000,000,000 ”

The occult powers of plants, animals, and minerals magically sympathize with the ‘superior natures,’ and the divine soul of man is in perfect intelligence with these ‘inferior’ ones. But during the barren periods, the latter lose their magic sympathy, and the spiritual sight of the majority of mankind is so blinded as to lose every notion of the superior powers of its own divine spirit. We are in a barren period: the eighteenth century, during which the malignant fever of skepticism broke out so irrepressibly, has entailed unbelief as an hereditary disease upon the nineteenth. The divine intellect is veiled in man; his animal brain alone *philosophizes*.” — 1:247

There are seven classes of Pitris . . . three incorporeal and four corporeal

p/q: *Vishṇu Purāṇa*, tr. Wilson, ed. Hall, 1864-77: “The Vāyu, Matsya, and Padma Purāṇas, and Hari Vaṃśa . . . agree in distinguishing the Pitris into seven classes; three of which are without form . . . and four are corporeal . . .” — 3:157 fn.

and two kinds, the Agnishwatta and the Barhishad

SEE: *Vishṇu Purāṇa*, tr. Wilson, ed. Hall, 1864-77: “The progenitors (Pitris), who . . . were created by Brahmā, were the Agnishwāttas and Barhishads; the former being devoid of, and the latter possessed of, fires.” — 1:156 (i.10)

Barhishad . . . are reborn as the *Sons of Atri*, and are the “Pitris of the Demons”

SEE: *The Ordinances of Manu*, tr. Burnell, ed. Hopkins, 1884: “The Barhiṣads, sons of Atri, are said (to be the fathers) of Daityas [titans] . . . and Rakṣasas [demons] . . .” — p. 68 (iii.196)

the Agnishwatta are reborn as Sons of Marichi . . . and are the Pitris of the Gods

SEE: *Vishṇu Purāṇa*, tr. Wilson, ed. Hall, 1864-77: “According to Kullūka on the *Laws of the Mānavas*, III., 195, the Agnishwāttas were sons of Marīchi . . .” — 2:303 fn.

p/q: *Vishṇu Purāṇa*, tr. Wilson, ed. Hall, 1864-77: “Again, in the same work [*Vāyu Purāṇa*], we have the incorporeal Pitris called Vairâjas, from being the sons of the Prajâpati Virâja . . .” — 3:158 fn.

There are thirty-three crores . . . of gods . . . “they may all be devas . . .”

SEE: T. Subba Row, “Notes on the Bhagavad Gita — II,” March 1887: “Do not make the mistake of thinking . . . that because we have thirty-three crores of *Devas*, we therefore worship thirty-three crores of gods.” — p. 360 (*The Theosophist*, v. 8)

“This is an unfortunate blunder . . . generally committed by Europeans. . . .”

p/q: T. Subba Row, “Notes on the Bhagavad Gita — II,” March 1887: “This is an unfortunate blunder generally committed by Europeans. *Deva* is a kind of spiritual being, and because the same word is used in ordinary parlance to mean god, it by no means follows that we have and worship thirty-three crores of gods. These beings, as may be naturally inferred, have a certain affinity with one of the three component *upadhis* into which we have divided man.” — p. 360 (*The Theosophist*, v. 8)

Thus the twelve great gods, *Jayas*, created by Brahmâ to assist him in the work of creation . . .

SEE: *Vishṇu Purāṇa*, tr. Wilson, ed. Hall, 1864-77: “In the beginning of the Kalpa, twelve gods, named *Jayas*, were created by Brahmâ, as his deputies and assistants in the creation. They, lost in meditation, neglected his commands . . .” — 2:26 fn.

they were cursed to be repeatedly born in each Manvantara . . .

p/q: *Vishṇu Purāṇa*, tr. Wilson, ed. Hall, 1864-77: “. . . he cursed them to be repeatedly born in each Manvantara, till the seventh. They were, accordingly, in the several successive Manvantaras, *Ajitas*, *Tushitas*, *Satyas*, *Haris*, *Vaikunṭhas*, *Sādhyas*, and *Ādityas*.” — 2:26-7 fn. (*Vāyu Purāṇa*)

they are *Tushitas* (in the second Kalpa), and *Ādityas* in the *Vaivasvata* period . . .

SEE: *Vishṇu Purāṇa*, tr. Wilson, ed. Hall, 1864-77: “These, who, in the Chākshusha Manvantara, were the gods called *Tushitas*, were called the twelve *Ādityas*, in the Manvantara of *Vaivasvata*.” — 2:27 (i.15)

With the Brahmins the Pitris are very sacred, because they are the Progenitors

SEE: *The Laws of Manu*, tr. G. Bühler, 1886: “A Brāhmaṇa who has been invited to a (rite) in honour of the manes [progenitors] shall always control himself . . . For the manes attend the invited Brāhmaṇas, follow them (when they walk) like the wind . . . The (various) classes of the manes are declared to be the sons of all those sages . . . the *Agnishvāttas*, the children of *Marīchi*, are famous in the world (as the manes) of the gods.” — pp. 110-12 (iii.188-9, 194, 195)

L’une d’elles serait ainsi un nom de l’Aurore [The daughters of Apollo-Leucippus are thus a mythological creation that is analogous to that of Phaethousa and Lampetia, the daughters of the Sun. One of them would thus be a name for the Dawn (or Twilight)] . . .” — p. 653

Zeus is shown as the father of the two heroes — born from the egg to which Leda gives birth

SEE: J. Lemprière, *Bibliotheca Classica*, 1833: “CASTOR and POLLUX, were twin brothers, sons of Jupiter [Zeus], by Leda . . . [Jupiter] changed himself into a beautiful swan Some suppose that Leda brought forth only one egg, from which Castor and Pollux sprung.” — 1:332

Leda is the mythical bird . . . in the traditions of various peoples . . .

p/q: P. Decharme, *Mythologie de la Grèce Antique*, 1886: “Lèda est donc l’oiseau mythique qui, dans les traditions des différents peuples de race aryenne, sous différents noms (oie, canard, poule), pond des œufs d’or [So Leda is the mythical bird who, in the traditions of different peoples of the Aryan race, under different names (goose, duck, chicken), lays golden eggs].” — p. 652

Pindar shows Leda uniting herself . . . to her husband and also to the father of the gods

p/q: P. Decharme, *Mythologie de la Grèce Antique*, 1886: “Chez Pindare, Lèda s’est unie dans la même nuit à son époux et au maître du ciel. Castor est le fils de Tyndare; Pollux est le fils de Jupiter {*Nem.*, X, 80 et suiv. Theocr., XXIV, 131} [In Pindar Leda is united, in the same night, with her husband and with the master of the heavens. Castor is the son of Tyndarus; Pollux is the son of Jupiter (Zeus) {*Nemeonikai*, x.80 et seq.; Theocritus, xxiv.131}].” — p. 652 & fn.

“The name *Adam* . . . or man, itself implies this double form of existence. . . .”

p/q: Alexander Wilder, “The Primeval Race Double-Sexed,” Feb. 1883: “The name *Adam*, or man, itself implies this double form of existence. It is identical with *Athamas* or *Thomas* (Tamil, *Tam*), which is rendered by the Greek *didumos*, a twin. If, therefore, the first woman was formed subsequently to the

first man, she must, as a logical necessity, be ‘taken out of man.’ Accordingly we read: ‘And the Lord God caused a deep sleep to fall upon Adam . . . and He took one of his *sides* and closed up the flesh . . . and the *side* which the Lord God had taken from man, made He a woman.’ ” — p. 113 (*The Theosophist*, v. 4)

“The Hebrew word . . . is *Tzala*, which bears the translation we have given . . .”

p/q: Alexander Wilder, “The Primeval Race Double-Sexed,” Feb. 1883: “The Hebrew word here used is *tzala*, which bears the translation which we have given. It is easy to trace this legend in Berosus, who says that *Thalath* (the *Omaroca*, or Lady of Urka), was the beginning of the creation. She was also Telita, the queen of the moon . . .” — p. 113 (*The Theosophist*, v. 4)

“The two twin births of *Genesis* . . .”

p/q: Alexander Wilder, “The Primeval Race Double-Sexed,” Feb. 1883: “The two memorable twin-births of *Genesis*, that of Cain and Abel, and of Esau and Jacob, shadow the same idea. The name *Hebel* is the same as Eve, and his characteristics seem to be feminine. ‘Unto thee shall be his desire,’ said the Lord to Cain; ‘and thou shalt rule over him.’ The same language had been uttered to Eve. ‘Thy desire shall be to thy husband, and he shall rule over thee.’ ” — pp. 113-14 (*The Theosophist*, v. 4)

“when 88° is reached, the boundary between liquid and gas vanished . . .”

p/q: Matthieu Williams, “Solids, Liquids, and Gases,” Dec. 9, 1881: “Then 88° is reached, and the boundary between liquid and gas vanishes; liquid and gas have blended into one mysterious intermediate fluid; an indefinite fluctuating something is there filling the whole of the tube — an etherialised liquid or a visible gas. Hold a red-hot poker between your eye and the light; you will see an upflowing wavy movement of what appears like liquid air. The appearance of the hybrid fluid in the tube resembles this,

but is sensibly denser, and evidently stands between the liquid and gaseous states of matter, as pitch or treacle stands between solid and liquid . . .” — p. 110 (*Knowledge*, v. 1)

The temperature at which this occurs has been named by Dr. Andrews . . .

p/q: Matthieu Williams, “Solids, Liquids, and Gases,” Dec. 9, 1881: “The temperature at which this occurs has been named by Dr. Andrews the ‘critical temperature;’ here the gaseous and liquid states are ‘continuous’ and it is probable that all other substances capable of existing in both states have their own particular critical temperatures.” — p. 110 (*Knowledge*, v. 1)

“Our notions of solids, liquids, and gases are derived from our experiences . . .”

p/q: Matthieu Williams, “Solids, Liquids, and Gases,” Dec. 23, 1881: “Our notions of solids, liquids, and gases are derived from our experiences of the state of matter here upon this earth. Could we be removed to another planet, they would be curiously changed. On Mercury water would rank as one of the condensible gases, on Mars, as a fusible solid, but what on Jupiter?” — p. 157 (*Knowledge*, v. 1)

“Recent observations justify us in regarding this as a miniature sun . . .”

p/q: Matthieu Williams, “Solids, Liquids, and Gases,” Dec. 23, 1881: “Recent observations justify us in regarding this as a miniature sun, with an external envelope of cloudy matter, apparently of partially condensed water, but red-hot, or probably still hotter within. His vaporous atmosphere is evidently of enormous depth, and the force of gravitation being on his visible outer surface $2\frac{1}{2}$ times greater than that on our earth’s surface, the atmospheric pressure in descending below this visible surface must soon reach that at which the vapour of water would be brought to its critical condition. Therefore we may infer that the oceans of Jupiter are neither of frozen, liquid, nor gaseous water, but are oceans or atmospheres of critical water. If any fish-birds swim or fly therein they must be very critically organised.” — p. 157 (*Knowledge*, v. 1)

As the whole mass of Jupiter is 300 times greater than that of Earth . . .

p/q: Matthieu Williams, “Solids, Liquids, and Gases,” Dec. 23, 1881: “As the whole mass of Jupiter is 300 times greater than that of the earth, and its compressing energy towards the centre proportional to this, its materials, if similar to those of the earth and no hotter, would be considerably more dense, and the whole planet would have a higher specific gravity, but we know by the movement of its satellites that, instead of this, its specific gravity is less than a fourth of that of the earth. This justifies the conclusion that it is intensely hot, for even hydrogen, if cold, would become denser than Jupiter under such pressure.” — p. 157 (*Knowledge*, v. 1)

“As all elementary substances may exist as solids, liquids, or gases . . .”

p/q: Matthieu Williams, “Solids, Liquids, and Gases,” Dec. 23, 1881: “As all elementary substances may exist as solids, liquids, or gases, or, critically, according to the conditions of temperature and pressure, I am justified in hypothetically concluding that Jupiter is neither a solid, a liquid, nor a gaseous planet, but a critical planet, or an orb composed internally of dissociated elements in the critical state, and surrounded by a dense atmosphere of their vapours, and those of some of their compounds, such as water. The same reasoning applies to Saturn and the other large and rarefied planets.” — p. 157 (*Knowledge*, v. 1)

“There is a peculiarity to which I must call your attention. . . .”

p/q: T. Subba Row, “Notes on the Bhagavad Gita — III,” April 1887: “There is a peculiarity in this passage to which I must call your attention. He speaks here of four Manus. Why does he speak of four? We are now in the seventh *Manwantara* — that of Vaivaswata. If he is speaking of the past Manus, he ought to speak of six, but he only mentions four. In some commentaries an attempt has been made to interpret this in a peculiar manner. The word ‘Chatwaraha’ is separated from the word ‘Manavaha’ and is made to refer to Sanaka, Sanandana, Sanatkumara and Sanatsujata, who were also included among the mind-born sons of Prajapati.” — p. 444 (*The Theosophist*, v. 8)

“But this interpretation will lead to a most absurd conclusion . . .”

p/q: T. Subba Row, “Notes on the Bhagavad Gita — III,” April 1887: “But this interpretation will lead to a most absurd conclusion, and make the sentence contradict itself. The persons alluded to in the text have a qualifying clause in the sentence. It is well known that Sanaka and the other three refused to create, though the other sons had consented to do so; therefore, in speaking of those persons from whom humanity has sprung into existence, it would be absurd to include these four also in the list. The passage must be interpreted without splitting the compound into two nouns. The number of Manus will be then four, and the statement would contradict the Puranic account, though it would be in harmony with the occult theory.” — p. 444 (*The Theosophist*, v. 8)
